The structure of this executive summary invites a word of explanation for the reader. Conventionally, such a summary presents the principal findings of a study and summarizes the research design and procedures by which the results were obtained. This report, however, is designed as a reference document consisting of a compendium of generic policy instruments and specific policy options that are available to the US Government in the event that it decides to encourage significant private sector to prevent, mitigate, or adapt to climate change. As such, most of the body of this report consists of summaries of existing knowledge about and experience with these policy instruments, and identifies opportunities and constraints for their application. The study did not attempt to establish a bottom-line recommendation, therefore, one cannot be presented here. 11 tabs.

53151 (DOE/ER/60304–5) **Evaluation of climatic models: Comparison of simulated and observed patterns for past climates: Progress report, February 1, 1989–January 31, 1990.** Prell, W.L.; Web, T. III; Kutzbach, J.E. Brown Univ., Providence, RI (USA). Dept. of Geological Sciences; Wisconsin Univ., Madison, WI (USA). Center for Climatic Research. Oct 1989. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER60304. Order Number DE90001228. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Comparison of the GCM results with paleoclimatic data can yield critical tests of the models that are being used in carbon dioxide research. In particular, the comparison of model results with paleoclimatic data can illustrate the sensitivity of the model's response to variations in the seasonal radiation budget as well as to changes in other boundary conditions. These comparisons also provide the opportunity to check the sensitivity of the climatic response of critical components of the climate system such as sea-ice and soil moisture. During the past several years, we have used paleoclimatic data to test NCAR CCM (National Center for Atmospheric Research, Community Climate Model) after changing its boundary conditions to those appropriate for simulating past climates. We have assembled regional and global paleoclimatic data sets of pollen, lake level, and marine plankton data and calibrated many of the data in climatic terms. We have also developed methods that permit direct quantitative comparisons between the data and model results. Our comparisons have shown both some of the strengths and weaknesses of the model. 64 refs.

53152 (DOE/ER/69017–1) **Climate system research studies of global and regional instrumental data: Progress report for period December 1, 1988–November 30, 1989.** Bradley, R.S.; Diaz, H.F.; Jones, P.D. Massachusetts Univ., Amherst, MA (USA). Sep 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-89ER69017. Order Number DE90001205. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Further improvements in the DOE temperature and precipitation station data sets have been made and a new merged set of temperature data (1851–1989) is in preparation. The world-wide precipitation data set is also being improved, and a study of precipitation variations over different continental regions was published. A draft of a joint US/USSR paper on temperature and precipitation changes over the last 150 years was also prepared. There were 1545 and 656 precipitation stations used in analyzing northern and southern hemisphere precipitation, respectively. All these stations had at least 35 years of data in the period 1921–60. The number of station records available declines dramatically for the 1970s and 1980s, particularly over Africa and Asia. Considerable amounts of additional precipitation data have been located for Africa, Australia and Asia, principally for the post-1970 period, and these are currently being digitized.

53153 (EPRI-EN–6526) **Paleoecological Investigation of Recent Lake Acidification (PIRLA), 1983–1985.** Charles, D.F.; Whitehead, D.R. (eds.). Electric Power Research Inst., Palo Alto, CA (USA); Indiana Univ. Foundation, Bloomington, IN (USA). c Oct 1989. 263p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The "Paleoecological Investigation of Recent Lake Acidification" (PIRLA) project, funded by the Electric Power Research Institute, is a broadly interdisciplinary paleoecological study of recent lake acidification. Approximately ten lakes are being studied in each of four low alkalinity regions in North America that are currently receiving acid deposition. The areas are the Adirondack Mountains (NY), northern New England, northern Great Lakes Region, and northern Florida. Sediment cores are being analyzed for diatom and chrysophyte remains to reconstruct acidification histories, including magnitude, rate, and timing of pH and alkalinity changes. Cores are dated using lead-210 and pollen and charcoal. Other sediment analyses include metals, sulfur, soot, and polycyclic aromatic hydrocarbons (PAH). These provide information on lake acidification histories, and the relative roles of natural acidification processes, watershed disturbance, and atmospheric deposition of strong acids. This interim report contains seven papers representing the status of project research as of March 1985. Results support the hypothesis that diatom and chrysophyte sediment stratigraphies can be used to determine the extent of past variations in the pH levels of lakes.

53154 (HESS–8801, pp. 43-49) **Global warming by carbon dioxide and other gases.** Tanaka, Masayuki (Tohoku Univ., Sendai (Japan)). Hydrogen Energy System Society, Tokyo (Japan). 17 Nov 1988. (In Japanese). (CONF-8811261–: 9. conference on researches on hydrogen energy system, Tokyo (Japan), 17 Nov 1988). In *Proceedings of the 9. conference on researches on hydrogen energy system.* Order Number DE89772186. Available from NTIS (US Sales Only), PC A04/MF A01.

The global warming by Co_2, etc. was investigated. The concentration of atmospheric CO_2 increased at a rate of 1.3 ppM/year in 1979-1985. As the consumption of carbon in fossil fuels is 5,100 million tons/year, 54 % of released CO_2 remained in the atmosphere. With CO_2 released from living organism taken into consideration, the proportion of remaining CO_2 in the atmosphere is 40-45 %, indicating 56-61 % of released CO_2 must be absorbed in the ocean. This has raised a problem since theories in the past do not support such a high rate of absorption by the ocean and quantitative analysis is required on sources of release and absorption. Significant uncertainty is left in the estimation of CO_2 concentration. Temperature rise of 3 +-1.5^{0}C in average and 2.5 time of this value for polar regions are estimated to be caused by doubled concentration of CO_2. Rapid increase in heat insulating from gas is another problem. Improved accuracy of observation and climatic models is essential for prediction of effects of CO_2 and other gases on climate. 6 references, 6 figures.

53155 (IEIE–8802, pp. 4) **Production of NOX and processing.** Ito, Yasuo (Musashi Institute of Technology, Tokyo (Japan)); Sakai, Takao; Ehara, Yoshiyasu. Institute of Electrical and Information Engineers (Japan). 5 Sep 1988. (In Japanese). (CONF-8810337–Pt.2: Joint convention record of institutes of electrical and information engineers, Niigata (Japan), 3-5 Oct 1988). In *Papers on*

lectures for joint conference of societies related to electricity and information. Available from NTIS (US Sales Only), PC A02/MF A01.

NO_2 is picked out as a representative of NOX for the experimental study on the production and decomposition characteristics by aerial discharge. NO_2 showed distinctive cyclic characteristics in association with other NO_2 series substances under somewhat low pressures. The result of the experimental study on the characteristics of decomposition by NO_2 mixed dilute gas is reported. HNO_3, O_3, NO_2, and NO repeat periodical generation and disappearance by the discharge in the air of approximately 250 Torr. The period is the factor of humidity, temperature, atmospheric pressure, and discharge current. NO_2 is decomposed by discharge, and the decomposed volume is nearly proportinal to the discharge current. The decomposition rate is the highest in Ar dilution, and the decomposition ratio is the best in the case of N_2 and Ar. O_2 dilution did not produce good NO_2 decomposition characteristics. 7 references, 7 figures.

53156 (ORNL/FTR–3378) **[The effects at ozone on CO_2 assimilation by bean plants]: Foreign trip report, September 2–15, 1989.** Norby, R.J. Oak Ridge National Lab., TN (USA). 25 Sep 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001094. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in ongoing laboratory experiments on the effects of ozone on Co_2 assimilation by bean plants, providing advice on experimental procedures, assistance with data analysis, and access to current literature. He presented a seminar in which the importance of research on elevated CO_2 and global climate change was emphasized because these are areas of major emphasis at Oak Ridge National Laboratory in which international collaboration would be especially beneficial. The most promising area for future collaboration was identified as the integration of experimental research with a tree growth model developed at Tartu University.

53157 (PB–89-190219/XAB) **Suitability of diffusion and wind-field techniques for an emergency-response dispersion model. Technical memo.** Eckman, R.M.; Dobosy, R.J. National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab. Apr 1989. 38p. (NOAA-TM-ERL-ARL–171). Available from NTIS, PC A03/MF A01.

Most atmospheric dispersion models have two separate components: a diffusion component that simulates the dilution of a contaminant by turbulence, and a wind-field component that transport the contaminant away from the source. Many modeling techniques have been developed for each of these components. This report examines the suitability of these modeling techniques for a near-field emergency response model that must simulate the dispersion of a hazardous contaminant out to several kilometers from a source. For an emergency response model that must provide real-time dispersion estimates (a Class A model), a puff model is the most appropriate diffusion technique, and simple interpolation is the most appropriate wind-field technique. For more-complex models that are used for emergency planning and post-accident assessments (Class B models), a puff model is still suitable, but the wind-field technique should be able to remove spurious velocity divergence and channel the wind flow in complex terrain.

53158 (PB–89-196323/XAB) **Handbook for decision on industrial atmospheric-contaminant exposure levels. Final Field Handbook.** Systems Control, Inc., Palo Alto, CA (USA). Jun 1974. 106p. (SCI–5103-2). Available from NTIS, PC A06/MF A01.

Portions of this document are not fully legible.

A Final Field Handbook developed as a procedural tool to determine if employee exposure to an atmospheric-contaminant level exceeds present federal standards is presented. First definitions of terms and notations are given, and then a step-by-step procedure is presented which implements the techniques developed. Specific examples of procedures are appended to illustrate and demonstrate the use of the handbook for computing the decision variables, determining and estimating a trend, decision-making, and obtaining estimates of contaminant level. Also illustrated are the use of a computational worksheet, the use of standardized graph paper and trend transparencies, and the use of the decision chart and estimation nomographs. A description of the mathematical formulation of trends and explanations of the trend-labeling method are presented. The relationship between the arithmetic average and the average value of a long-normally distributed variable is discussed, and blank copies of worksheets and standardized graphs are provided.

53159 (PB–89-197214/XAB) **Onset of electrical breakdown in dust layers. 2. Effective dielectric constant and local field enhancement.** Young, R.P.; DuBard, J.L.; Sparks, L.E. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1988. 8p. (EPA–600/J-88/289). Available from NTIS, PC A02/MF A01.

Part 1 of the work has shown that electrical breakdown in dust layers obeys Paschen's Law, but occurs at applied field values which appear too small to initiate the breakdown. In this paper the authors show how an effective dielectric constant characterizing the dust layer can be determined from AC dielectric measurements and the theory of Debye. When combined with an expression for the enhanced local electric field in the void spaces between particles in the layer, field strengths which are large enough to initiate electrical breakdown in the layer are predicted at relatively low values of applied field. The effect of temperature and dust-layer thickness on the onset of electrical breakdown within the dust layer can also be explained by the dependence of the effective dielectric constant on these parameters.

53160 (PB–89-197743/XAB) **Onset of electrical breakdown in dust layers. 1. Microsparking described by paschen's law.** Young, R.P.; DuBard, J.L.; Sparks, L.E. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1988. 10p. (EPA–600/J-88/253). Available from NTIS, PC A02/MF A01.

Pub. in Jnl. of the Air Pollution Control Association, Vol. 38, No. 11, 1412-1418(Nov 1988).

This paper describes a study of the onset of electrical breakdown in dust layers, for hand-deposited dust layers in a parallel-plate geometry. It was found that the breakdown was an ordinary electron-avalanche process originating in voids within the dust layer and obeying Paschen's Law. The size of voids where breakdown occurs was in the range of 10-20 micrometers for the layers used. The distribution of particle sizes in a sample influences its breakdown through changes in the average void dimension where breakdown takes place. Water vapor in the test environment, which affects the electrical conduction mechanism prior to breakdown, lowered the average electric field required to initiate breakdown. Moderate compaction of the sample had little or no effect on its breakdown behavior.

53161 (PB–89-197883/XAB) **Investigation of two features of continuously released heavy gas plumes. Report for September 1986-December 1988.** Hall, D.J.; Waters, R.A. Warren Spring Lab., Stevenage (UK). 1989. 57p. (LR–707(PA)M). Available from NTIS, PC EE04/MF E04.

Color illustrations reproduced in black and white.

This report describes an investigation, using a wind tunnel model, of two specific aspects of the dispersion of continuously released, ground based, heavy gas plumes. These were, firstly, to examine the range of releases which might be described as 'slightly heavy' gases, in which the plume passes from the neutrally buoyant state to that of a clearly heavier-than-air plume with a high degree of stability and strongly density driven flow components. Secondly, the effect of source size on plume dispersion was examined for two distinct plume types, one of relatively small scale with respect to the source and with a modest degree of stability, and one of relatively large scale with respect to the source and with a high degree of stability. A significant feature of the results is the sensitivity of the plume to the detailed form of the source.

53162 (PB–89-197909/XAB) **Assessment of particle and heavy-metal concentrations in the atmosphere around the Port Talbot works of the British Steel Corporation. Report for February-May 1987.** Davis, B.J. Warren Spring Lab., Stevenage (UK). 1988. 34p. (LR–636(PA)M). Available from NTIS, PC EE05/MF E05.

This report describes a survey carried out around the British Steel Corporation's Port Talbot works. Port Talbot works is one of five large integrated steel works operated by the British Steel Corporation within the United Kingdom. The objective of such surveys is to

assess the possible contribution of emissions, with emphasis on low-level fugitive emissions, i.e., those emanating from below stack height, to their concentrations in the ambient atmosphere using the Directional M-type Sampler.

53163 (PB–89-197941/XAB) **Assessment of particle and lead concentrations in the atmosphere around Associated Octel Ltd. at Ellesmere Port. Report for August 1986-January 1987.** Davis, B.J. Warren Spring Lab., Stevenage (UK). 1988. 39p. (LR–677(PA)M). Available from NTIS, PC EE05/MF E05.

Concentrations of lead in the ambient atmosphere have been measured during a twenty-two week period at four sites in the vicinity of Ellesmere Port. The measurements were made using a directional M-type sampler, which provided two weekly samples. One was taken when the wind was blowing from the direction of the works, the second during all other wind directions. For fifteen weeks at the SHOP, Admin and Cabot sites, and for the whole of the survey period at the Poole Centre, the sampling filters were modified to measure both inorganic and organic lead. The proximity of the SHOP and Cabot sites to the works taken in conjunction with the relevant enhancement factors suggests that the works was contributing low-level (in terms of height) fugitive emissions of organic lead to the ambient atmosphere.

53164 (PB–89-197958/XAB) **Ozone monitoring in the UK (United Kingdom): A review of 1978/8. Data from monitoring sites operated by Warren Spring Laboratory.** Bower, J.S.; Broughton, G.F.; Dando, M.T. Warren Spring Lab., Stevenage (UK). 1988. 63p. (LR–678(AP)M). Available from NTIS, PC EE06/MF E06.

Color illustrations reproduced in black and white.

A new national air-quality monitoring network has been established for the Department of the Environment. Its purpose is to determine rural baseline concentrations of ozone and other pollutants throughout the United Kingdom. The report describes the background to the establishment of the network, together with its present structure and instrumentation. A series of data analyses are presented and discussed, with the intention of providing a broad and preliminary overview of ozone observations at WSL-operated monitoring sites throughout the first full year of network operation. Average and peak levels of ozone during 1987/8 are quantified, seasonal and diurnal variations are determined, and high pollution periods are examined.

53165 (PB–89-197966/XAB) **Acid rain in the United Kingdom: Spatial distributions and seasonal variations in 1986. Report for January 1986-August 1988.** Campbell, G.W.; Cocksedge, J.L.; Coster, S.M.; Dennis, A.L.; Devenish, M. Warren Spring Lab., Stevenage (UK). 1988. 72p. (LR–691(AP)M). Available from NTIS, PC EE06/MF E06.

Color illustrations reproduced in black and white.

Maps of the concentration and deposition of acidity and other ions over all of the United Kingdom during 1986 have been drawn. The results are compared with the limited data available for earlier periods. Seasonal variations are presented and box plots used to summarize information on frequency distributions. Analyses of daily measurements have provided estimates of 'background' non-marine sulfate concentration in rain and the contributions of United Kingdom and European sources to non-marine sulfate deposition at a site in East Anglia.

53166 (PB–89-197990/XAB) **UK (United Kingdom) emissions of air pollutants, 1970-1986.** Eggleston, H.S. Warren Spring Lab., Stevenage (UK). 1988. 30p. (LR–659(AP)M). Available from NTIS, PC EE05/MF E05.

Emissions of CO, NOx, SO, and VOC into the atmosphere from the UK are presented for the years 1970-1986. Tables giving more detail for the period 1976-1986 are included. This is the first in a projected annual series of publications.

53167 (PB–89-200828/XAB) **EPA (Environmental Protection Agency) Regional Oxidant Model (ROM2.0): Evaluation on 1980 NEROS data bases. Report for January 1987-April 1989.** Schere, K.L.; Wayland, R.A. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab. Jun 1989. 370p. (EPA–600/3-89/057). Available from NTIS, PC A16/MF A01.

The second-generation U.S. EPA Regional Oxidant Model (ROM2.0) has been evaluated for the northeastern United States using the 1980 NEROS data bases. The theoretical basis of the model and its structure and organization are described. The data bases available from the summer 1980 period include routine air-quality and meteorological monitoring data in addition to data from several extensive field-measurement projects conducted during the summer of 1980 in the northeastern U.S. on regional and urban scales. Also, a complete emissions inventory, composed of anthropogenic and biogenic components, was assembled for the 1980 base year for use in air-quality modeling. The ROM2.0 evaluation was conducted using quasi-deterministic and diagnostic techniques.

53168 (PB–89-203889/XAB) **Summary of data on individual organic contaminants in sediments collected during 1984, 1985, 1986, and 1987. Progress report.** National Ocean Service, Rockville, MD (USA). Office of Oceanography and Marine Assessment. Apr 1989. 149p. (NOAA/TM/NOS/OMA–47). Available from NTIS, PC A07/MF A01.

Since 1984, the National Oceanic and Atmospheric Administration's National Status and Trends Program has analyzed samples of surface sediment collected at about 200 coastal and estuarine sites throughout the United States. The chemical contaminants measured are chlorinated pesticides, polychlorinated biphenyls, polyaromatic hydrocarbons, and 12 trace elements. The report, containing the data for the individual organic chemicals, is a supplement to the previously issued report that contained all the metal and aggregated organic data.

53169 (PB–89-204697/XAB) **Research on noise and environmental issues. Transportation Research Record.** Weiss, M.; Creasey, F.T.; Agent, K.R.; Slutsky, S.; Bertoni, H.L. National Research Council, Washington, DC (USA). Transportation Research Board. 1988. 102p. (TRB/TRR–1176). Available from NTIS, PC A06/MF A01.

Library of Congress catalog card No. 89-9364.

The 12 papers in the report deal with the following areas: Summary of highway noise barrier construction in the United States; Effectiveness of traffic noise barrier on I-74 in Campbell County, Kentucky; Analysis and programs for assessment of absorptive and tilted parallel barriers; Tilted Parallel Barrier Program: application and verification; Construction noise: I-78 through the Watchung Reservation; Highway traffic noise prediction for microcomputers: modeling of Ontario simplified program; Noise barriers and the community involvement process; Overview of NJDOT's mitigation program; Acoustical insulation design for existing schools and residences near San Francisco International Airport; Development and verification of the California line source dispersion model; Dispersion characteristics of flows in asymmetric street canyons and sensitivity to block shape; Corrections to hot- and cold-start vehicle fractions for microscale air-quality modeling.

53170 (PB–89-204721/XAB) **Development and implementation of an up-to-date photochemical mechanism for use in airshed modeling. Appendices A-C. Summary report, 2 May 1986-2 May 1988 (Final).** Carter, W.P.L.; Atkinson, R. California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center. Oct 1988. 713p. Available from NTIS, PC A99/MF E04.

A two-year program was carried out to develop an updated gas-phase photochemical mechanism for airshed models and computer software for its implementation. Current knowledge of the gas-phase chemistry of emitted organics was comprehensively reviewed and evaluated. The gas-phase mechanism previously developed by the authors was updated and extended to include representations of the kinetics and representations of over 100 types of emitted organic compounds. Several condensed mechanisms for use in airshed models were developed, allowing model users to choose the appropriate level of chemical detail for their application. Software was developed for the automatic preparation of chemical mechanisms for use in airshed models. Emissions-processing procedures and software were developed to allow model users to derive the kinetic and mechanistic parameters for the species in the model which corresponds to those for the emitted species which they represent. Assignments of detailed model species were made for over 350 categories of emitted organics, accounting for essentially all of

the mass of identified organic emissions into California air basins in the 1983 emissions inventory data base.

53171 (PB–89-206643/XAB) **Wind direction effects on dispersion from sources downwind of steep hills.** Castro, I.P.; Snyder, W.H.; Lawson, R.E. Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Sciences Research Lab. Jan 1988. 12p. (EPA–600/J-88/335). Available from NTIS, PC A03/MF A01.

Pub. in Atomospheric Environment, Vol. 22, No. 10, 2229-2238(1988).

A previous experimental study of the nature of dispersion from point sources down-wind of three-dimensional hills of various cross-wind aspect-ratio (spanwise breadth/height) was extended to the case when the approaching wind is not normal to the spanwise axis of the hill. Surface concentration patterns resulting from sources placed at various heights were examined, with attention limited to cases which led to the greatest concentration for the normal wind direction (theta=0). Sufficient data have been obtained to determine the terrain amplification factor (i.e., the ratio of the maximum ground-level concentration in the presence of the hill to that in its absence) for various wind directions, hills and source heights, and also to find how the ground-level concentration at the position of its maximum value for theta=0 varies with wind direction. It is demonstrated that in some circumstances the amplification factor (A) for a particular source position actually increases with small changes in wind direction. In general, however, there is a monotonic decrease in A as theta deviates from zero, which is most rapid for hills of small aspect ratio. In the case of wider hills, it is possible for the amplification factor to be reduced below unity for large theta.

53172 (PB–89-206676/XAB) **Video images of smoke dispersion in the near wake of a model building. Part 1. Temporal and spatial scales of vortex shedding.** Huber, A.H. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab. 1988. 38p. (EPA–600/J-88/332). Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Wind Engineering and Industrial Aerodynamics, Vol. 31, 189-224(1988).

In a wind-tunnel study, recorded video images of smoke dispersion in the wake of a rectangular-shaped building were analyzed. A continuous source of smoke was emitted at floor level, midway along the leeward side of the building. Smoke was observed to build up within a region adjacent to the building. Then the smoke was periodically swept away by vortices shed from the leeward building sides and roof. The applicability of analyzing time series of smoke scattered light for selected quantized video picture elements was favorably demonstrated. Temporal and spatial scales of vortex-shedding of smoke puffs near the center of the wake were quantified through the calculation of spectral densities and autocorrelations. The dominant frequencies (cycles/second) near the center of the wake flow were found to be 0.1-0.3 times the ratio of the velocity to the building height. Estimated integral length scales near the center of the wake flow were found to be 1-2 times the building height.

53173 (PB–89-206718/XAB) **Evidence for cloud venting of mixed-layer ozone and aerosols.** Ching, J.K.S.; Shipley, S.T.; Browell, E.V. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1988. 20p. (EPA–600/J-88/327). Available from NTIS, PC A03/MF A01.

Pub. in Atmospheric Environment, Vol. 22, No. 2, 225-242(1988).

Observations are presented which substantiate the hypothesis that significant vertical exchange of ozone and aerosol pollutants occurs between the mixed layer and the free troposphere during cumulus cloud convective activity. Flight experiments conducted in July 1981, utilized the airborne Ultra-Violet Differential Absorption Lidar system developed by NASA. This system provides simultaneous range-resolved ozone concentration and aerosol-backscatter profiles with high spatial resolution. Data were obtained during the afternoon along East to West and South to North intersecting transects over North Carolina in the presence of active, non-precipitating cumulus clouds.

53174 (PB–89-206726/XAB) **Modeling ozone concentrations: Urban- and regional-scale models are needed to develop emission-control policies that reduce ozone levels.** Schere, K.L. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. May 1988. 10p. (EPA–600/J-88/326). Available from NTIS, PC A02/MF A01.

Pub. in Environmental Science and Technology, Vol. 22, 488-495(May 1988).

Regional-scale air-quality models are needed for coordinated planning of emission-control strategies to reduce the ozone pollutant burden. Urban-scale models by themselves cannot provide the link from one source area to the next. In the paper the structural components of the more rigorous grid-type regional ozone models are described along with some of the issues that must yet be resolved to achieve credible regional scale simulations. Chief among these issues are the questions of the magnitude and photochemical effects of regional-scale biogenic organic emissions, the mass transfer from the lower to upper boundary layer by cloud fluxes, the lack of determinism in regional-scale wind fields, and perhaps most critically, how to properly describe the subgrid scale chemical and physical processes within the enormous volume of a regional gridcell. The major components and recent applications of five representative regional-scale air-quality models are presented.

53175 (PB–89-206742/XAB) **Performance of a Gaussian model for centerline concentrations in the wake of buildings.** Huber, A.H. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1988. 14p. (EPA–600/J-88/324). Available from NTIS, PC A03/MF A01.

Pub. in Atmospheric Environment, Vol. 22, No. 6, 1039-1050(1988).

The inherent variability of 10- to 60-min average ground-level plume centerline concentrations in the wake of buildings and inherent limitations on the performance of a Gaussian plume model are presented. Point comparisons between observed and model-predicted concentrations were evaluated for three sets of field measurements. The presentation is based on a quantitative evaluation of the same model that was qualitatively evaluated in another presentation. The same method prescribed for estimating enhanced dispersion in the wake of buildings and its incorporation into the Gaussian plume equation is used here. A sample of performance measures is judged to provide an adequate basis for determining the strengths and weaknesses of the model. For groups with reduced measures of mean error, the variability among errors was reduced to values between 50 and 100% of the mean concentration, which appears here to represent the inherent limitation of a simple Gaussian plume model.

53176 (PB–89-206809/XAB) **Summary of selected data on chemical contaminants in sediments collected during 1984, 1985, 1986, and 1987. Technical memo.** National Ocean Service, Rockville, MD (USA). Office of Oceanography and Marine Assessment. Nov 1988. 105p. (NOAA/TM/NOS/OMA–44). Available from NTIS, PC A06/MF A01.

Since 1984, the National Oceanic and Atmospheric Administration's (NOAA) National Status and Trends (NS&T) Program has analyzed samples of surface sediment collected at about 200 coastal and estuarine sites throughout the United States. The chemical contaminants measured are chlorinated pesticides, polychlorinated biphenyls (PCSs), polyaromatic hydrocarbons (PAHs), and 12 trace elements. Sediment characteristics such as grain size, which affect contaminant concentrations, have also been quantified. With few exceptions, the higher levels of contamination have been found among the 175 sites where the sediment is muddy rather than sandy. Most of the highest concentrations for any particular contaminant have been at the 20 sites near Boston, New York, San Diego, Los Angeles, or Seattle. Despite being sandy, sediments at two Long Island Sound sites showed high levels of PAHs. Except for some sites near the Florida cities of Jacksonville, Tampa, Panama City, and Ft. Walton Beach, levels of contamination at sites in the Gulf of Mexico and in the southeastern United States were relatively low.

53177 (PB–89-207021/XAB) **Statistical comparison of results of two indoor-air pilot studies. Final report, 10 December 1987-29 February 1988.** Mack, G.A.; Stockrahm, J.W.; Chuang, J.C. Battelle Columbus Div., OH (USA). Jun 1989. 146p. Available from NTIS, PC A07/MF A01.

See also PB–87-129524.

The objective of the study was to compare the results between two previous indoor-air PAH monitoring studies conducted by EPA in 1984 and 1987. Both of the previous studies were pilot studies involving ambient and indoor air monitoring at a small number of residences in Columbus, Ohio. The objectives of these studies were to characterize the ranges of selected PAH and nitrogen heterocyclic compounds in the indoor air and to evaluate contributions of various indoor combustion sources to the indoor PAH concentration levels. The current study compared the results between the 1984 and 1987 studies and, where the results were consistent, the data from the two studies were combined to produce more-precise statistical estimates of concentration-level ranges and estimates of the contributions of different indoor combustion sources to indoor PAH levels.

53178 (PB–89-207476/XAB) **Stratospheric ozone depletion.** Environmental Protection Agency, Washington, DC (USA). Information Management and Services Div. May 1989. 72p. (EPA/IMSD–89/001). Available from NTIS, PC A04/MF A01.

This bibliography focuses solely on stratospheric ozone depletion. Global climate change, a related issue, is not within its scope. The first section contains an overview of stratospheric ozone issues. The second section, entitled 'science', discusses atmospheric chemistry and dynamics, specifically trace gas emissions and ozone/UVB levels. The third section contains citations relating to risk assessment for humans and other organisms. Section IV includes information on domestic and international public policy. The fifth section outlines research on substitutes and alternatives for ozone-depletion substances. Worldwide participants in the Montreal Protocol are listed in the Appendix.

53179 (PB–89-208375/XAB) **Micrometeorological investigation of surface exchange of trace gases: A case study. Technical memo.** Hicks, B.B.; Matt, D.R.; McMillen, R.T. National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab. Mar 1989. 78p. (NOAA-TM-ERL-ARL–172). Available from NTIS, PC A05/MF A01.

Data obtained in an intensive field study of the dry deposition of sulfur dioxide, ozone, and nitrogen dioxide, conducted in 1985 in central Pennsylvania, are used to illustrate the factors that must be considered to assure that high-quality results are derived. In particular, the quality of the site must be such that flux measurements made above the surface are representative of surface values. For this purpose, tests involving momentum transfer and the surface energy budget are especially useful. In addition, conditions must not be changing rapidly, and the statistical uncertainty associated with flux measurement must be low. For the set of data presented here, conservative quality-assurance guidelines are used to reject potentially erroneous flux data.

53180 (PB–89-208649/XAB) **Estimation of contemporary carbon in fine-particle aerosols from the 1987 SCAQS (Southern California Air Quality Study) program. Final report.** Global Geochemistry Corp., Canoga Park, CA (USA). Apr 1989. 64p. Available from NTIS, PC A04/MF A01.

See also PB–86-223427.

During the Southern California Air Quality Study of 1987, the aerosol content of biogenic carbon was investigated. Twenty-four-hour fine-particle aerosol samples were collected at four sites, and the carbon in the samples was analyzed for content of the radioactive isotope ^{14}C (which decays with a half-life of 5730 years and is not present in fossil fuels). The percentage of modern carbon varied in 36 samples between 17.3 and 97.6%. These high contents of modern carbon indicate the possibility that 20% of the fine-particle atmospheric aerosol (as organic matter and elemental carbon) in the southern California urban area is due to non-fossil fuel emissions.

53181 (PB–89-208961/XAB) **Study of the NO_3 radical decomposition reaction and the N_2O_5 in equilibrium with NO_3 + NO_2 equilibrium constant. Final report.** Davidson, J.A.; Cantrell, C.A.; Shetter, R.E.; Calvert, J.G. National Center for Atmospheric Research, Boulder, CO (USA). Atmospheric Chemistry Div. 1989. 97p. Available from NTIS, PC A05/MF A01.

A determination was made of several important spectroscopic and thermodynamic properties of three oxides of nitrogen which are important in atmospheric chemistry, NO_2, NO_3 and N_2O_5. In the first phase, a redetermination was made of the absorption cross sections of NO_2 (visible and ultraviolet regions), NO_3 (visible region), and N_2O_5 (infrared regions), the effects of temperature, concentration of gas and instrument resolution on the cross sections were determined. The new cross section data were used in the second phase of the study in the redetermination of the equilibrium constant for N_2O_5 dissociation: $N_2O_5 > NO_3 + NO_2$. The first studies designed to measure the apparent first order decay of the NO_3 radical shed new light on the several conflicting results related to these parameters, and allow a clearer choice of reliable data for use in the simulation of the atmospheric chemistry of the oxides of nitrogen and in the prediction of reasonable control strategies for these oxides.

53182 (PB–89-209670/XAB) **Time-resolved size distributions of sub-4 micrometers particle sulfur and nitrate. Final report.** Allen, D.T. California Univ., Los Angeles, CA (USA). Dept. of Chemical Engineering. 1989. 83p. Available from NTIS, PC A05/MF A01.

Size-segregated atmospheric aerosol was collected at Claremont, California during the 1987 Southern California Air Quality Study (SCAQS) using low-pressure impactors. The single-orifice impactors separated the aerosol into eight size fractions, ranging in aerodynamic diameter from 0.05 micrometer to greater than 4 micrometers. The size fractions were analyzed for sulfur using a flash volatilization-flame photometric method, for nitrate using ion chromatography, and for nitrate, carbonyl, and aliphatic carbon using infrared spectroscopy. These measurements of aerosol composition were coordinated with experiments conducted by other CRC-APRAC contractors. The other contractors measured ambient visibility and the changes in particle size associated with changes in humidity. The data collected in these experiments will be a rigorous test of current visibility models and will help to guide future work in atmospheric visibility modeling.

53183 (PB–89-214431/XAB) **National dioxin study: Analytical procedures and quality assurance plan for the analysis of 2,3,7,8-TCDD in Tier 3-7 samples of the US Environmental Protection Agency National Dioxin Strategy.** Environmental Protection Agency, Duluth, MN (USA). Environmental Research Lab. May 1986. 41p. (EPA–600/3-85/019). Available from NTIS, PC A03/MF A01.

See also PB–87-213963.

Analytical methodology used by EMSL-RTP, ECL-BSL, and ERL-D in the analysis of samples for the study of Tiers 3-7 in the U.S. EPA National Dioxin Strategy is provided. The methods are based on low- and high-resolution mass spectrometry using stable-isotope-labeled internal standards. The methods were peer reviewed by the Quality Assurance Committee for the National Dioxin Strategy, as revised in November 1984. The methods are to serve only as a guideline for these analyses and may be modified as required to successfully meet target detection limits.

53184 (PB–89-217897/XAB) **Air-toxics technical assistance for the state of Alaska. Final report.** Dickson, R.J.; Peoples, S.H.; Oliver, W.R. Radian Corp., Sacramento, CA (USA). 30 Mar 1987. 261p. (DCN–87-203-024-81-02). Available from NTIS, PC A12/MF A01.

An air toxics emission inventory was developed for the state of Alaska. The inventory focuses on both point (i.e., specifically identified facilities) and area sources. The area source inventory does not identify facilities, but instead consists of aggregated emission totals for a geographic area. Activity data were obtained for the time periods ranging from 1979 to 1986. Included in the report are exact sources of information and the time periods for which they were derived, and a summary of point and area source emissions by source type. Also included are tables of data by air toxic compound and a detailed list of the point source emissions by source. Threshold limit values were used to rank the emission sources and the results are tabulated.

53185 (PB–89-220586/XAB) **Laboratory and field evaluation of a methodology for determination of hydrogen chloride emissions from municipal and hazardous-waste incinerators.** Steinsberger, S.C.; Margeson, J.H. Entropy Environmentalists, Inc., Research Triangle Park, NC (USA). Apr 1989. 83p. Available from NTIS, PC A05/MF A01.

Laboratory and field studies were performed to develop and evaluate a sampling and analytical technique for measuring hydrogen chloride (HCl) from stationary sources. Studies were conducted in three phases (1) literature seach and development of a candidate sampling and analysis protocol, (2) laboratory evaluation and refinement of the protocol, and (3) field evaluation. A modified Method 6 sampling train was selected for sample collection due to its ease of operation, availability, and cost. An acidified water-absorbing solution was identified for collecting HCl in the impingers. The acidified water solution was selected to minimize the potential for diatomic chlorine (Cl_2) to interfere with the HCl determination. Ion chromatography was selected as the most suitable technique for the analysis of HCl. The laboratory phase evaluated the HCl collection efficiency of the sampling protocol and the distribution of Cl_2 in the sampling train. A preliminary field test was included in the laboratory phase to indicate any further protocol modifications. A ruggedness test was designed to evaluate the effect of six variables that may be encountered when employing the sampling protocol. A field evaluation was conducted to determine the precision and estimate the accuracy of the sampling and analytical protocol. The candidate method was also employed to determine the bias and precision of two HCl continuous emission-monitoring systems.

53186 (PB–89-865869/XAB) **Indoor air pollution: Health effects. January 1970-July 1989 (Citations from the COMPENDEX data base). Report for January 1970-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 39p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning health effects associated with indoor pollutants. Pollutants discussed include carbon dioxide, nitrogen oxides, particulates, formaldehyde, carbon monoxide, paints, pesticides, solvents, smoke, sealants, soils, adhesives, aerosols, dusts, cleaners, and moisture. Health effects ranging from simple discomfort and tight or sick building syndrome to maladies such as Legionnaires' disease and cancer are discussed. Test methods for detecting indoor pollutants are briefly cited. (Contains 61 citations fully indexed and including a title list.)

53187 (PNL-SA–16496-1) **Global energy and the greenhouse issue.** Scott, M.J.; Edmonds, J.A.; Kellogg, M.A.; Schultz, R.W. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-890901–1: 14. world energy conference, Montreal (Canada), 17-22 Sep 1989). Order Number DE90001394. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Global energy production and use results in the release of Co_2 and other gases to the atmosphere which affect the atmosphere's radiative character. The accumulation of CO_2 and other radiatively important (RIGs) is thought to result in higher mean global surface temperatures and other climatic changes, whose character would vary regionally around the globe. Of critical importance to determining the timing and magnitude of global climate change is an understanding of long term global energy systems. 19 refs., 3 tabs.

53188 (UBA-FB–87-092/1.1.1) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 45 t/h steam boiler fueled with heavy oil.** Luetzke, K.; Sobottka, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 132p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

Over a period of one year the emission of dust, selected heavy metals and trace elements and, randomly sampled, also of SO_2, SO_3, NO and CO from a 45 t/h steam boiler burning heavy oil were measured in two periods. Furthermore, the particle size distribution in flue dust and the dew point of the acid were determined. On the average 1.3 respectively 1.8 t fuel oil/h were burned. The medium dust load of the waste gas amounted to 8 respectively 9.7 mg/m^3. After the two measurement periods the boiler was cleaned. Samples of the boiler ash, the fuel and the flue dust were analyzed for the presence of Cd, Cr, Hg, Ni, Pb, V and Zn in order to determine specific emissions rates for the individual elements with Cd, Hg, Ni, Pb and V also measured in the gas phase, and to allow balancing. Cr, Pb and Zn showed comparatively good balances while about 50% of the Ni and V burned with the fuel was found again in the emission. Together Ni and V made up for about 97% of the total emission of the elements examined here. The average values determined by the analyses were: 50% value of the particle size distributions in flue dust: 0.8-1.1 μm; dew point of the acid: 148^{0}C; waste gas concentrations of $SO_2/SO_3/(NO+NO_2)$ calculated as NO_2/CO: 2078/165/<10 mg/m^3. The specified concentrations (mg/m^3) refer to dry waste gas of standard temperature and pressure with 3% oxygen. (orig.) With 13 refs., 49 tabs., 25 figs.

53189 (UBA-FB–87-092/1.1.2) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 25 t/h steam boiler fueled with heavy oil.** Luetzke, K.; Sobottka, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 41p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

For 5 days of measurement the emissions of dust, selected heavy metals and trace elements (As, Cd, Cr, Hg, Ni, Pb, Se, Tl, V and Zn) from a 25 t/h steam boiler burning heavy oil were determined. As, Cd, Hg, Se and Tl were also measured in the gas phase. For the waste gas dust loadings between 33 and 46 mg/m^3, i.e. a mean value of 38 mg/m^3 referred to dry waste gas with 3% by volume of oxygen were measured. Among the substances examined vanadium with a mean value of 9.9 mg/m^3 and nickel with a mean value of 1.8 mg/m^3 made up the largest fraction. About 90% of the ash brought in together with the boiler fuel was emitted and about 10% precipitated inside the boiler. The results of the balances for Cr, Ni, Pb, V and Zn partly differed from these values. (orig.) With 17 tabs., 3 figs.

53190 (UBA-FB–87-092/1.2.1) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system.** Luetzke, K.; Sobottka, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 100p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

For a stationary fluidized-bed firing plant for various fuels with a steam boiler downstream and a combination of cyclone separator and fabric filter for waste gas dedusting upstream, the mass flows of dust, selected heavy metals and trace elements (As, Be, Cd, Cr, Cu, Hg, Mn, Ni, Pb, Se, Te, Tl, V and Zn) were determined (As, Cd, Hg, Se and Tl also for the gas phase) which are emitted together with the waste gases when firing coal middlings and high-grade coal. Furthermore the particle size distribution in pure gas dust was determined by impacter measurements. The specific emission factors for the individual elements were calculated and the corresponding balances for the system 'fluidized-bed firing plant' were established. For the heavy metals and trace elements examined in this context distinctively higher concentrations in the pure gas compared to the source material, especially for coal of high value, and parallel concentrations in the range of small size fractions (up to 85% in the range <1,4 μm) were detected. The average dust emission from high-grade coal combustion amounted to 0.13 kg/h and by the firing of middlings to 0.39 kg/h with a 50% value of the particle size distribution in pure gas dust of 4 μm respectively 3 μm. The highest emission factors referred to 1 TJ thermal output were determined for the firing of coal of high value (7.1 g of Zn, 6.5 g of Pb, 6.1 g of V, 5.1 g of Ni and 4.5 g of Mn) and for the firing of middlings (35.2 g of Zn, 8.8 g of Mn, 6.2 g of V, 4.4 g of Cu and 4.0 g of Pb). (orig.) With 8 refs., 28 tabs., 21 figs.

53191 (UBA-FB–87-092/1.2.2) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system.** Luetzke, K.; Sobottka, H. Rheinisch-Westfaelischer Technischer

Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 32p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

In addition to the determination of trace elements and heavy metal content of waste gases from the burning of various fuels in a stationary fluidized-bed combustion plant with subsequent steam boiler and a combination of preceding cyclone separator and fabric filter for waste gas dedusting, measurements for the determination of the mass contents of sulphur dioxide (SO_2), nitrogen oxides (NO, NO_2) and gaseous inorganic chlorine and fluorine compounds (CL^-, F^-) in the waste gases from the burning of coal tailings and coal of high value were carried out under otherwise equal conditions. Furthermore mass flows of sulphur, nitrogen, chlorine and fluorine brought in by the fuel were determined. The examinations were carried out to allow statements on the emission behaviour and retention capacity of the plant with regard to the substances mentioned above. For sulphur, chlorine and fluorine retention degrees of 68%/39%/about 100% were measured for coal retailings and 79%/61%/94% for high-grade coal. The concentration of SO_2 in pure gas amounted to 610 mg/m^3 respectively 430 mg/m^3 and the concentration of nitrogen oxide (calculated for NO_2) amounted to 688 mg/m^3 respectively 609 mg/m^3; all values refer to dry waste gas at standard temperature and pressure with an oxygen content of 7%. (orig.) With 6 refs., 10 tabs., 2 figs.

53192 (UBA-FB–87-092/1.2.3) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a circulating fluidized-bed system.** Luetzke, K.; Scheuer, A.; Sobottka, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 112p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

For a circulating fluidized-bed combustion plant for coal of high inerts, equipped with a secondary steam boiler and a heat exchanger for the recovery of process heat, upstream mill drying of the coal and waste gas dedusting by fabric filters, the mass flows of dust, selected heavy metals and trace elements (As, Be, Cd, Cr, Hg, Mn, Ni, Pb, Se, Te, Tl and V) emitted with the waste gases were determined (for As, Cd, Hg, Se, Te and Tl also for the gas phase). Furthermore the particle size distribution in pure gas dust was determined by way of impacter measurements. The specific emission factors for the individual elements were determined and the corresponding balances for the system 'fluidized-bed firing plant' prepared. The comparison of the contents of trace elements showed for all elements with the exception of Tl increasing concentrations on its way from the source material to the pure gas. The medium dust emission amounted to a maximum 4.1 kg/h and a 50% value of the particle size distribution in pure gas dust of 3.0-3.5 μm. The highest emission factors determined were: 11.9 g of Hg, 3.3 g of Mn, 2.4 g of Pb, 2.2 g of V and 2.1 g of Te reffered to 1 TJ thermal output. (orig.) With 10 refs., 36 tabs., 12 figs.

53193 (UBA-FB–87-092/2.1) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion.** Luetzke, K.; Klee, W. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 57p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

For the ashing of 2.34-3.06 t/h of dry material in a combustion plant for sewage sludges (primary and anaerobic sludge) provided with a fluidized-bed furnace, an additional furnace for light fuel oil, and waste gas purification by multiple cyclone and venturi washer the mass flows of dust, selected heavy metals and trace elements (As, Be, Cd, Cr, Hg, Mn, Ni, Pb, Se, Te, Tl, V) as emitted with the waste gases were detemined (As, Cd, Hg, Pb, Se, Te and Tl also for the gas phase). In connection with other examinations it was proved that the elements As, Cd, Se, Te and Tl brought in together with the combustion material and the additional fuel are evidently higher concentrated in the pure gas dust than in the source material. With the exception of Hg and Se all elements brought in remained predominantly bonded in the bunker ash and only a maximum of 1% was set free. The Hg, however was almost completely emitted in the gas phase. The highest emission factors referred to 1 t of dry ash material were determined as: 3.97 g of Hg, 0.12 g of Cr, 0.09 g of Pb and 0.06 g of Mn. (orig.) With 5 refs., 15 tabs., 11 figs.

53194 (UBA-FB–87-092/2.2) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant.** Luetzke, K.; Klee, W. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 57p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

For the ashing of 1.29 t/h of solid, 1.52 t/h of mixed solid and liquid and 1.06 t/h of liquid waste in a combustion plant for non-dumpable solid and liquid industrial waste with waste heat boiler and waste gas dedusting by a single-stage horizontal-flow electrical precipator, the mass flows of dust, selected heavy metals and trace elements (As, Be, Cd, Cr, Cu, Hg, Mn, Ni, Pb, Se, Te, Tl, V and Zn) emitted together with the waste gases were measured (As, Cd, Hg, Se and Tl were also measured in the gas phase). In connection with other investigations the concentration of elements brought in with the combustion material and the additional fuel, in particular Cd and Se, could be detected. Specific emission factors were calculated for the indivdual elements. The mean dust emission from the ashing of solid, mixed solid and fluid and fluid waste amounted to 2.8 kg/h, 2.1 kg/h respectively 1.0 kg/h. The highest emission factors were determined in dependence of the type of ashed material and referred to 1 t of waste: 91-544 g of Pb, 132-488 g of Zn, 7.3-13.0 g of Cd, 3.9-13.0 g of Cr and 3.7-9.5 g of Cu. (orig.) With 1 ref., 13 tabs., 8 figs.

53195 (UBA-FB–87-092/2.3) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant.** Luetzke, K.; Sobottka, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 114p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

In a combustion plant for municipal waste equipped with a cylinder grate furnace, an additional furnace for heavy fuel oil, an integrated 50 t/h steam boiler, a two-stage electrical horizontal-flow preciptator and an 'acid' venturi washer for waste gas purification, 15-20 t/h of domestic waste were ashed and the mass flows of dust, lead (Pb), cadmium (Cd) and mercury (Hg) carried with the waste gases were determined (Pb, Cd and Hg also for the gas phase) as they were present in the crude and the pure gas of the waste gas purification system and between the electrical precipitator and the venturi washer. Furthermore, the concentrations of SO_2, SO_3, $NO+NO_2$ (calculated as NO_2) and other gaseous inorganic chlorine (Cl^-) and fluorine (F^-) compounds were measured in the crude and the pure gas of the venturi washer. The specific separation efficiencies of the venturi washer referred to the material flow brought in with the waste gases were determined for NO + NO_2/Cl^-/F^- and Hg as: 16-19%/99.2-99.6%/80.3-95.5% behind the waste gas purification system as compared with the crude gas dust. The emission factors referred to 1 t of 'domestic waste' were calculated as: 5.1-22.6 g of Pb, 0.44-0.85 g of Cd and 0.32-0.52 g of Hg. (orig.) With 16 refs., 33 tabs., 11 figs.

53196 (UBA-FB–87-092/5) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on an interlaboratory study on the precision of chemical methods of heavy metal and trace element analysis.** Luetzke, K.; Grossmann, W. Rheinisch-Westfaelischer Technischer

Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 79p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

4 experienced laboratories took part in a cooperative test to confirm the chemical analyses of trace elements and heavy metals in material flows and emissions from various plants carried out in the course of the overall project and to obtain more distinctive data on the precision of such analyses. With the help of atomic absorption spectrometry 14 elements in 8 different substances and 2 filter residue samples were identified twice by placing dust samples, two at a time, on the quartz wad carrier respectively on quartz fibre table filters (dust mass only about 10 mg). As a final result of the evaluation of the interlaboratory test scattering values, the reproducibility r and comparability R were determined and discussed. For carrier-free samples the repeatabilities r of most elements and substances were <25% and the comparabilities between 25 and 50% (relative). The scattering values increase as expected for samples on filter mediums with own scattering power, especially for small sample quantities. (orig.) With 16 refs., 20 tabs.

53197 (UBA-FB–87-092/6) **Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements.** Luetzke, K.; Kier, B.; Bach, H.; Fricke, H.; Hauschild, H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). Oct 1987. 103p. (In German). Contract UFOPLAN-Nr. 10403185. Available from Copy held by UB/TIB Hannover.

In addition to the determination of trace elements and the heavy metal contents for selected industrial, commercial and communal plants a nation-wide registration of the number, size and mode of operation of plants of the type examined was carried out. The registration was based on the evaluation of general statistical material, business reports and technical publications as well as in a more detailed way by a well-aimed inquiry of plant operators the addresses of which were made available by professional associations or were gathered from technical publications or from lists of references. As for glass tanks a detailed registration was not possible due to insufficient information from the operators' side; boiler plants burning heavy oil was not available information as the necessary expenditure was expected to be too high. As far as communal refuse incineration plants are concerned an already existing detailed registration was evaluated. Among the plant operators addressed the operators of lignite-fuelled steam power plants respectively cylindrical rotary cement kilns proved to be particularly cooperative. All results obtained from the registration were presented in tables and explained to an adequate extent. (orig.) With 17 refs., 23 tabs.

53198 (UCRL–21214-Summ.) **Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Summary report.** Lawrence Livermore National Lab., CA (USA); Industry Cooperative Hydrogen Fluoride Mitigation/Assessment Program (USA). Water Spray Subcommittee. Jun 1989. 36p. DOE Contract W-7405-ENG-48. Order Number DE90001181. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Several companies proposed the development of design information for water sprays as part of a mitigation system for facilities that either produce or consume HF. The program was composed of three separate components: water sprays, vapor barriers and ambient impact assessment. The objective of the water spray component was to investigate the effectiveness of water sprays in mitigating acid releases as a function of flow conditions, acid and spray properties and geometries factors. The water spray study consisted of HF and water laboratory studies and field studies. The HF laboratory studies were designed to conduct HF releases on a small scale. They had three objectives: to help define the test matrix for the larger scale field testing; to evaluate design criteria for a larger flow chamber; and to gain operating experience for the larger unit. These HF tests were performed at Mobil Central Research Laboratories at Princeton, during May and June of 1988. In addition, water laboratory studies were conducted to characterize the water spray curtain used in the field testing. This report summarizes the results from the HF laboratory studies and the field studies, which comprise the water spray component. 15 refs., 18 figs., 1 tab.

53199 (UCRL–21214-Vol.1) **Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 1, Detailed report.** Lawrence Livermore National Lab., CA (USA); Industry Cooperative Hydrogen Fluoride Mitigation/Assessment Program (USA). Water Spray Subcommittee. Jun 1989. 214p. DOE Contract W-7405-ENG-48. Order Number DE90001048. Available from NTIS, PC A11/MF A01 - OSTI.

Accidental releases of pressurized, superheated hydrogen fluoride (HF) can result in initially dense clouds which will typically contain a mixture of HF vapor, aerosol, and droplets. Previous experiments were performed by Amoco Oil Company and Lawrence Livermore National Laboratories (the Goldfish series in 1986) to study atmospheric dispersion of these HF clouds. The present study examines the effect of water application on the mitigation of these clouds. To assess the effectiveness of water application (via either sprays or monitor) in mitigating HF clouds two series of tests were conducted in separate flow chambers. Bench scale experiments identified key variables for testing in larger scale field tests demonstrated that HF releases can be mitigated with water. The impact of numerous design variables on mitigation effectiveness has also been quantified. HF removal efficiencies of 25 to 90+% have been demonstrated at water to HF liquid ratios of 6/1 to 40/1 and higher. 8 refs., 69 figs., 50 tabs.

53200 (UCRL–21214-Vol.2) **Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 2, Appendices A–D.** Lawrence Livermore National Lab., CA (USA); Industry Cooperative Hydrogen Fluoride Mitigation/Assessment Program (USA). Water Spray Subcommittee. Jun 1989. 184p. DOE Contract W-7405-ENG-48. Order Number DE90001180. Available from NTIS, PC A09/MF A01 - OSTI.

Accidental release of pressurized, superheated hydrogen fluoride (HF) can result in initially dense clouds which will typically contain a mixture of HF vapor, aerosol, and droplets. Previous studies experiments were performed by Amoco Oil Company and Lawrence Livermore National Laboratories (the Goldfish series in 1986) to study atmospheric dispersion of these HF clouds. The 1987 measuring programme has been enlarged with measurements of Kr-85 in the air and of the content of I-29 in various samples. The measured values continue to show the effects of the reactor accident in Chernobyl. Though the concentration of the activities of Cs-134 and Cs-137 has fallen in nearly all food samples, by comparison with the values of 1986, the measured values are still noticeably higher than earlier values. The amount of the concentration of activity not only depends on the type of foodstuff, but it shows, just as in 1986, considerable local and periodic fluctuations. The concentration of activity decreased considerably in Spring 1987, after the increase of Cs-134 and Cs-137 concentrations in milk, in Autumn 1986. Due to experiences obtained from surface nuclear weapons tests, Cs-134 and Cs-137 resulting from the Chernobyl accident may be expected to constitute the essential fraction of all artificial radioactive substances in the samples within the next few years as well. (orig./HP).

53205 (IPPJ-REV–3, pp. 39-45) **Atmospheric tritium in three different chemical forms in Fukuoka.** Okai, Tomio (Kyushu Univ., Fukuoka (Japan). Faculty of Engineering); Takashima, Yoshimasa. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

A portable tritium sampling system was developed for the stepwise collections of tritiated water vapor (HTO), tritiated hydrogen (HT) and tritiated hydrocarbons (CH_3T) in the atmosphere. According to the system, the collection efficiencies of HTO, HT and CH_3T were all estimated to be nearly 100%. Tritium concentrations of HTO, HT and CH_3T in the atmosphere in Fukuoka were measured from 1984 to the present. Atmospheric HTO concentration varies within range from 0.15 to 1.64 pCi/m^3-air of from 22 to 86 pCi/l-H_2O. HTO concentrations expressed in pCi/m^3 show the trend that they are higher in summer and lower in winter. This trend is similar to the variation of atmospheric absolute humidity expressed in g/m^3-air. On the other hand, HT and CH_3T concentrations generally show no seasonal variations with the almost constant values of 0.78-1.90 pCi/m^3 and 0.21-0.86 pCi/m^3, respectively. Annual averaged concentrations of atmospheric tritium expressed in pCi/m^3 are about 0.55, 1.14 and 0.38 for HTO, HT and CH_3T, respectively. On the other hand, the specific activities written in tritium unit (TU) are about 16, 10^6 and 4 x 10^4 for HTO, HT and CH_3T, respectively. These facts obviously indicate that not only HTO but also HT should be considered to estimate the radiation effect of tritium to human being, and that the origins of tritium involved in these species are quite different. (author).

53206 (JAERI-M–89-041) **Analysis of the wind data and estimation of the resultant doses from the supersonic anemometer. A comparison study of the supersonic and propeller wind data.** Hu, Shze Jer; Katagiri, Hiroshi; Kobayashi, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Apr 1989. 55p. Order Number DE90709989. Available from NTIS (US Sales Only), PC A04/MF A01.

Statistical analyses and comparisons of the wind data obtained by the propellar and supersonic anemometers for the year of 1987 in Japan Atomic Energy Research Institute, Tokai Establishment were performed. The resultant average air concentrations and ground level external γ exposure rates due to the radioactive releases for the normal operation of a nuclear power plant are overestimated when calculated using the properller wind data. The difference is due to the influence of low wind speeds. If the frequencies of low wind speed are large, wind data observed by the supersonic, which could measure even low wind speed more precisely then the propeller, should be used in the atmospheric dispersion analysis to yield a more accurate and realistic estimation of the air concentration and ground level external γ exposure rate. The analysis also shows that the adult thyroid exposure dose of the postulated accident is sufficiently accurate and valid when estimated basing on the contributions of individual iodine nuclides without considering their decay and using the supersonic wind data without having to modify the assumed mean wind speed of the calm. For the external γ whole body exposure of the postulated accident, accurate and realistic estimation should base on the contributions of individual radionuclides with their decay considered and use the supersonic wind data for atmospheric dispersion analysis. (author).

53207 (JAERI-M–89-062) **Development of a three-dimensional local scale atmospheric model with turbulence closure model.** Yamazawa, Hiromi. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 27p. Order Number DE90710045. Available from NTIS (US Sales Only), PC A03/MF A01.

Through the study to improve SPEEDI's capability, a three-dimensional numerical atmospheric model PHYSIC (Prognostic HYdroStatic model Including turbulence Closure model) was developed to apply it to the transport and diffusion evaluation over complex terrains. The detailed description of the atmospheric model

was given. This model consists of five prognostic equations; the momentum equations of horizontal components with the so-called Boussinesq and hydrostatic assumptions, the conservation equations of heat, turbulence kinetic energy and turbulence length scale. The coordinate system used is the terrain following z_* coordinate system which allows the existence of complex terrain. The minute formula of the turbulence closure calculation, the surface layer process, the ground surface heat budget, and the atmospheric and solar radiation were also presented. The time integration method used in this model is the Alternating Direction Implicit (A.D.I.) method with a vertically and horizontally staggered grid system. The memory storage needed to execute this model with 31 x 31 x 16 grid points, five layers in soil and double precision variables is about 5.3 MBytes. The CPU time is about 2.2×10^{-5} s per one step per one grid point with a vector processor FACOM VP-100. (author).

53208 (LLNL–90001492) **Diode calibration manual.** Brunk, J.L. Lawrence Livermore National Lab., CA (USA). Sep 1989. 1044p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (M–262). Order Number DE90001492. Available from NTIS, PC A99/MF A01 - OSTI.

This procedure is not for the faint of heart. It is a time consuming, complex series of journeys through advanced GAMANAL and the vagueness of analyzer electronics. A knowledge of TRIX AC, DLTV, and IMP on the Octopus system and DSCOPE, PE2, and Symphony on a PC class machine is required. Be aware that the example in this document is a condensation of information that takes up four feet of shelf space. In the attempt to convert the nomenclature of the 7600 version of GAMANAL to that of the CRAY version, there will be confusion with some of the terms used. The 7600 versions relied on punched cards to a great extent where the CRAY version doesn't use them at all. In order not to introduce a new set of nomenclature, I have changed the reference from card to card image. I hope that this will cause the least impact on the vernacular and cause the least amount of confusion possible. This document is a rewritten update of an unpublished document by Bob Wikkerink in 1980. His document was the only written record of the procedures needed to calibrate the Environmental Sciences Low Level Counting Facility. This document updates and expands this information.

53209 (UCRL–101215-Rev.1) **Evaluation of an emergency response model with instantaneous air concentrations during stable conditions: Revision 1.** Baskett, R.L.; Mitchell, C.S. Lawrence Livermore National Lab., CA (USA). Aug 1989. 6p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract W-7405-ENG-48. (CONF-891103–30-Rev.1: Winter meeting of the American Nuclear Society, San Francisco, CA (USA), 26-30 Nov 1989). Order Number DE90001053. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The STABLE project (STAble Boundary Layer Experiment) is a multiyear research effort planned by the Department of Energy to study the effects of turbulence and diffusion on plumes in the stable boundary layer. Conducted by the Savannah River Laboratory (SRL) at Savannah River Plant (SRP), near Aiken, South Carolina, in April 1988, the first STABLE field experiment provides a unique tracer data set for evaluating dispersion models. The unique aspect of the experiment was that instantaneous air concentrations were collected. When short-term toxicity is an issue in an accidental release, emergency response requires consideration of peak concentrations. The purpose of this paper is to show the comparison of the SRL STABLE data with Lawrence Livermore National Laboratory's (LLNL) Atmospheric Release Advisory Capability (ARAC) emergency response dispersion models. 2 refs., 1 fig.

53210 Detection of uranium from cosmos-1402 in the stratosphere. Leifer, R. (Dept. of Energy, New York, NY (USA)); Juzdan, Z.R.; Kelly, W.R.; Fassett, J.D.; Eberhardt, K.R. *Science (Washington, D.C.) (USA),* 238: 512-514 (23 Oct 1987).

The nuclear reactor from the Soviet radar reconnaissance satellite, Cosmos-1402, reentered the earth's atmosphere on 7 February 1983 and disintegrated over the South Atlantic Ocean. The reactor was powered by approximately 50 kilograms of uranium-235 (^{235}U). In an effort to determine the fate of the reactor core, a series of aerosol samples were collected at altitudes between 27 and 36 kilometers in the Northern Hemisphere approximately 1.1 years late by high-altitude balloons. At an altitude of 36 kilometers a 53 ± 20% excess in the ^{235}U concentration was measured. The total excess of ^{235}U in the stratosphere was calculated to be 44 ± 15 kilograms. 20 refs., 1 fig., 5 tabs.

This report is the fourth of an annual series describing the Nation's water resources, focuses on ground-water quality, and summarizes the ambient quality of ground water in the principal water-supply aquifers and describes the nature and extent of ground-water contamination in each State, the District of Columbia, and the territories. Each summary contains multicolor illustrations that show selected geographic features and the 1985 population distribution; the location of principal aquifers and presentations of data related to water quality in those principal aquifers; and the location of selected waste sites, areas of naturally impaired groundwater quality, and areas reflecting human-induced contamination. Also summarized are the State agencies, laws, and regulations involved in ground-water-quality management.

53212 (EPA–450/3-89-31) **Benzene emissions from coke by-product recovery plants, benzene storage vessels, equipment leaks, and ethylbenzene/styrene process vents: Background information and responses to technical comments for 1989 final decisions: Final EIS.** Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Aug 1989. 189p. Sponsored by Environmental Protection Agency. Available from NTIS, PC A09/MF A01 - OSTI.

Final decisions have been made on regulation of benzene emissions from existing and new coke by-product recovery plants, benzene storage vessels, equipment leaks, and ethylbenzene/styrene process vents. These decisions implement Section 112 of the Clean Air Act and are based on the Administrator's determination of June 8, 1977 that benzene presents a significant risk to human health as a result of air emissions from one or more stationary source categories, and is therefore a hazardous air pollutant. This document contains a summary of the comments on the proposal of these standards in the Federal Register, the Environmental Protection Agency's response to these comments, and a summary of the health, environmental and economic impacts of the final standards.

53213 (PB–89-167894/XAB) **Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility.** Waterland, L.; Lee, J.W. Acurex Corp., Jefferson, AR (USA). Apr 1989. 248p. Available from NTIS, PC A11/MF A01.

A series of demonstration tests of the American Combustion, Inc., Thermal Destruction System was performed under the SITE program. This oxygen-enhanced combustion system was retrofit to the rotary-kiln incinerator at EPA's Combustion Research Facility. The system's performance was tested firing contaminated soil from the Stringfellow Superfund Site, both alone and mixed with a coal tar waste (KO87). Comparative performance with conventional incinerator operation was also tested. Compliance with the incinerator performance standards of 99.99% principal organic hazardous constituents (POHC) destruction and removal efficiency and particulate

emissions of less than 180 mg/dscm at 7% O2 was measured for all tests. The Pyretron system was capable of in-compliance performance at double the mixed waste feedrate and at a 60% increase in batch waste charge mass than possible with conventional incineration. Scrubber blowdown and kiln ash contained no detectable levels of any of the POHCs chosen.

53214 (PB–89-167902/XAB) **Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report.** Rosenthal, S. Enviresponse, Inc., Livingston, NJ (USA). Apr 1989. 125p. Available from NTIS, PC A06/MF A01.

See also Volume 2, PB–89-167910.

A Superfund Innovative Technology Evaluation (SITE) Program demonstrated the Shirco Infrared System (pilot plant) for thermally processing PCB waste at Rose Township, Michigan. The process was evaluated by the U.S. EPA and is reported in Volume I of the report. Results reported in Volume I indicated that PCB was removed from the feed material with a DRE greater than 99.99%. The destructive ratio (percent of PCB in the ash compared to feed) was greater than 83% resulting in a less than 1 ppm concentration in the ash. Particulate emissions, products of incomplete combustion (PICs) and acid-gas emissions were below any standards. Metals in the ash leached by the TCLP and EP Tox. were below suggested standards.

53215 (PB–89-167910/XAB) **Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report.** Rosenthal, S. Enviresponse, Inc., Livingston, NJ (USA). Apr 1989. 599p. Available from NTIS, PC A25/MF A01.

See also Volume 1, PB–89-167902.

The performance of the Shirco pilot-scale infrared thermal destruction system has been evaluated at the Rose Township, Demode Road Superfund Site and is presented in the report. The waste tested consisted of solvents, organics and heavy metals in an illegal dump site. Volume II is the test program, copies of the original operating data, sampling analysis report and quality assurance plan.

53216 (PB–89-207914/XAB) **Review of the national ambient air-quality standards for lead: exposure analysis methodology and validation. Staff report (Final).** Cohen, J. Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Jun 1989. 172p. (EPA–450/2-89/011). Available from NTIS, PC A08/MF A01.

This report summarizes relevant information on multi-media lead exposure and presents the modeling methodologies that EPA staff believes should be considered for the review of the national ambient air-quality standards for lead. Results of validating one of these methodologies are also presented. The significant downward trends in gasoline lead emissions and lead concentrations in the diet are accounted for in these methodologies. Young children, pregnant women (as exposure surrogates for the fetus), and middle-aged men are identified as particularly susceptible to lead. Three different exposure methodologies, developed from a wide variety of data are described: the uptake/biokinetic and aggregate air lead models, both applicable to young children, and the disaggregate air lead model, which is applicable to both young children and adults. The uptake/biokinetic model allows explicit projections of future lead concentrations in different media and in turn can estimate the impacts of these changes on different age groups of children. It is this flexibility that makes the uptake/biokinetic model adaptable for a wide range of predictive exposure assessments and why it was the focus of the validation exercises described in the paper. Results of these exercises indicate good concordance between predicted and observed blood lead-levels in children living near different lead point sources.

5101 Basic Studies

53217 (CONF-8909227–1) **The systems approach to environmental assessment.** O'Neill, R.V. Oak Ridge National Lab., TN (USA). 1989. 34p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Integrated environmental management meeting; Aiken, SC (USA); 26-28 Sep 1989. Order Number DE90000579. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The systems approach in ecology is both a methodology and a holistic mindset. As a methodology, it utilizes mathematical and computer models to simulate natural ecosystems. As a mindset, it focuses on the total functioning and overall properties of the ecosystem. The distinction between methodology and mindset forms a convenient outline for the present review. Under the rubric of methodology, I will discuss the applicability of ecological models to environmental assessment. Under holistic mindset, I will consider the feasibility of assessing impacts on overall ecosystem function. In both cases, we will find that the systems approach has much to offer in assessing environmental impacts. The approach encourages a comprehensive viewpoint and avoids the pitfalls that result from focusing too closely on a single population or process. At the same time, we will find that the systems approach is no panacea. No single approach should be relied upon (or ignored) in addressing complex assessment issues. 92 figs.

53218 (DP-MS–88-239) **Home range: A spatially continuous fractal approach.** Loehle, C.; Ostee, R.; Gilman, T.L. Westinghouse Savannah River Co., Aiken, SC (USA). [1989]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-8908155–1: Ecological Society of America meeting, Toronto (Canada), 3 Aug 1989). Order Number DE89017861. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A great deal of work has been done on home range quantification and description. All current methods, however, share an approach that leads to fundamental difficulties. We develop a completely new conception of the home range that is spatially continuous rather than point-oriented and that incorporates sample error. It leads to a more robust measure of competition than overlap of utilization distributions. Seasonal movements and habitat relations can be inferred even from rather approximate telemetry data. For studies of travel distance or home range (territory size), however, accuracy of the method is important. In particular, estimation of foraging times and energetics calculations based on travel distance depend on the accuracy of location estimates. For any given pair of points for which travel distance is to be calculated, two types or error interfere with a straight line distance measure. First, point estimates have associated measurement error (point estimate error) which may be quite large for telemetry data. Second, animals rarely travel in straight lines. The path actually taken from point A to B is typically much longer than the straight line from A to B unless A and B were measured quite closely in time. This is interval estimate error which creates an unusual sampling problem. Unlike more accurate measurement of something like mass, more "accurate" interval estimation achieved by increasing the sample frequency results in an increase in total length. This divergence is characteristic of fractal objects. Other such diverging measures include cloud boundaries, coastlines, surface "area" in mountainous terrain, and other irregular objects. Note that increasing the time between samples until statistical independence is achieved causes even more loss of information concerning true distances traveled between sample points. 24 refs., 1 fig.

Analysis of all stable noble gas isotopes in KTB core rocks provides a good opportunity to characterize the geochemical reservoir 'continental crust' and to study mixing and transport processes between the various earth reservoirs. (orig.).

53221 (INIS-mf–12006, pp. 156-157) **TL-dating of ancient copper slags.** Lorenz, I.B.; Wagner, G.A. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

TL ages of copper slags are commonly different from independently known ages, which is due to inhomogeneous distribution of radioactive constituents and inhomogeneous TL sensitivity of the TL phosphors. (orig.).

53222 (INIS-mf–12006, pp. 157) **Thermoluminescence dating of quaternary sediments and paleolithic sites.** Zoeller, L.; Wagner, G.A. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The loess chronology of the latest glacial periods was established in great detail by thermoluminescence dating. Horizons containing Middle and Upper Palaeolithic finds were successfully dated. (orig.).

53223 (INIS-mf–12006, pp. 157-158) **Development and transfer of the early copper metallurgy.** Begemann, F. (Max-Planck-Institut fuer Chemie (Otto-Hahn-Institut), Mainz (Germany, F.R.)); Schmitt-Strecker, S.; Lorenz, I.; Krajnovic, D.; Lutz, J.; Pernicka, E.; Philipps, R.; Wagner, G.A. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Studies on early copper metallurgy in the Anatolian and Agean areas include chemical and isotopic analyses of ores and artefacts as well as field work. (orig.).

53224 (INIS-mf–12006, pp. 158) **Geochemical, lead, and sulfur isotope classification of polymetallic ore deposits from NE Greece.** Chalkias, S.; Wagner, G.A.; Pernicka, E. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Trace element as well as sulfur and lead isotope characteristics from polymetallic ore deposits show no significant discrimination of deposits from different tectonic zones. (orig.).

53225 (ORNL–6011) **Nevada applied ecology group publications.** Chilton, B.D.; Pfuderer, H.A.; Cox, T.L. Oak Ridge National Lab., TN (USA). Sep 1989. 246p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. (NVO/AEIC–264). Order Number DE90002111. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

Since January 1972, the Nevada Applied Ecology Information Center (NAEIC), Information Research and Analysis Section, Health and Safety Research Division, Oak Ridge National Laboratory, has provided technical information support to the Nevada Applied Ecology Group (NAEG) relevant to the behavior of specific radionuclides, primarily plutonium and americium, in the environment, with special emphasis on pathways to man. This bibliography represents a summary of the biomedical and environmental studies conducted by the NAEG and its contractors. The bibliography focuses on research sponsored by the NAEG. Subject areas of the publications include cover studies of soil, vegetation, animals, microorganisms, resuspension, and meteorology. All references in this publication are stored in a computerized form that is readily available for searches upon request to NAEG and it contractors. 558 refs.

53226 (ORNL/FTR–2496) **[Collection of high quality acoustical records for honeybees]: Foreign trip report, January 24–February 1, 1987.** Kerr, H.T.; Buchanan, M.E. Oak Ridge National Lab., TN (USA). 19 Feb 1987. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017299. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

High quality acoustical data records were collected for both European and Africanized honeybees under various field conditions. This data base was needed for more rigorous evaluation of a honeybee identification technique previously developed by the travelers from preliminary data sets. Laboratory-grade recording equipment was used to record sounds made by honeybees in and near their nests and during foraging flights. Recordings were obtained from European and Africanized honeybees in the same general environment. Preliminary analyses of the acoustical data base clearly support the general identification algorithm: Africanized honeybee noise has significantly higher frequency content than does European honeybee noise. As this algorithm is refined, it may result in the development of a simple field-portable device for identifying subspecies of honeybees. Further, the honeybee's acoustical signals appear to be correlated with specific colony conditions. Understanding these variations may have enormous benefit for entomologists and for the beekeeping industry.

53227 (CONF-8909214–1) **The food chain as a source of human exposure to organic chemicals.** Hattemer-Frey, H.A.; Travis, C.C. Oak Ridge National Lab., TN (USA). [1989]. 61p. Sponsored by Environmental Protection Agency. DOE Contract AC05-84OR21400. From Washington risk assessment conference; Arlington, VA (USA); 27 Sep 1989. Order Number DE90001074. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Although human exposure to environmentally released pollutants can occur via several pathways including, inhalation, ingestion of contaminated food items, infant consumption of mother's milk, and dermal absorption, of particular concern are potential exposures from ingesting contaminated food items, since the food chain has been shown to be a primary source of human exposure to a large class of organics, including DDT, TCDD, pentachlorophenol, benzo(a)pyrene, and most pesticides. For risk assessment purposes, an important objective in evaluating the environmental behavior and fate of various pollutants is predicting the major pathways and extent of human exposure. Many chemicals cycle in the environment with cross-media transfers occurring between air, water, soil, and biota. As a result of this cycling behavior and a chemical's presence in various environmental media, human exposure often results from multiple sources. We found that 50–80% of all chemicals released into the environment result in human exposure through multiple media. The purpose of this presentation is to provide a perspective on the food chain as a source of human exposure to organic chemicals chronically released into the environment. 121 refs., 3 figs., 9 tabs.

53228 (PNL–7134) **Resource Conservation and Recovery Act ground-water monitoring projects for Hanford facilities: Progress report, April 1–June 30, 1989.** Smith, R.M.; Bates, D.J.; Lundgren, R.E. Pacific Northwest Lab., Richland, WA (USA). Sep 1989. 254p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. Order Number DE90000988. Available from NTIS, PC A12/MF A01 - OSTI; GPO Dep.

This report describes the progress of 13 Hanford ground-water monitoring projects for the period April 1 to June 30, 1989. These projects are for the 300 area process trenches (300 area), 183-H solar evaporation basins (100-H area), 200 areas low-level burial grounds, nonradioactive dangerous waste landfill (southeast of the 200 areas), 1301-N liquid waste disposal facility (100-N area), 1324-N surface impoundment and 1324-NA percolation pond (100-N area), 1325-N liquid waste disposal facility (100-N area), 216-A-10 crib (200-east area), 216-A-29 ditch (200-east area), 216-A-36B crib (200-east area), 216-B-36B crib (200-east area),

216-B-3 pond (east of the 200-east area), 2101-M pond (200-east area), grout treatment facility (200-east area).

53229 (UCID–21764) **Remedial investigation of landfill Pit 8 Lawrence Livermore National Laboratory Site 300.** Environmental Restoration Series. Taffet, M.J. Lawrence Livermore National Lab., CA (USA). Aug 1989. 112p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90000932. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report documents our investigation of the geology and hydrogeology beneath inactive landfill Pit 8 at Lawrence Livermore National Laboratory Site 300. Site 300 is located about 15 miles east of Livermore, California, in rugged, rural terrain on the east side of the Altamont Hills; this remote facility is used for the testing of explosives and materials to support LLNL's national defense programs. Landfill Pit 8 is located in San Joaquin County in the northeastern portion of Site 300. Since August 1987, trichloroethylene (TCE) has been detected in ground water from one well to a maximum of 6 μg/L. Ground water from a second well has contained lower concentrations of TCE since the last quarter of 1988. We began this investigation in mid-1988 to determine the extent and sources of TCE at the landfill site and to define local hydrogeology. This report presents the results and conclusions of the investigation. 17 refs., 6 figs., 2 tabs.

53230 (UCRL–101850) **Cooperative, multi-disciplinary problem solving for chemical accidents.** Koopmam, R.P. Lawrence Livermore National Lab., CA (USA). Aug 1989. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8907103–11: Technology-based confidence building: energy and environment, Santa Fe, NM (USA), 9-14 Jul 1989). Order Number DE90001513. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Chemical accidents will always occur as long as hazardous chemicals continue to play an important role in our culture. The frequency of such events must be kept very low in order for the public to continue to accept the risks they create. The most important and first line of defense must always be prevention. This is the industry position and where industry puts most of its resources. It is also, in my opinion, the proper focus for most of the effort in hazardous chemical safety and must be maintained as a vital ongoing effort. It is, however, mainly up to the various industries to maintain this work. Thus, the solution to the problem of chemical accidents is cooperative, multi-disciplinary problem solving, involving industry, government, researchers, and the public. If this is done well, it will build confidence in the technology which dominates modern life. This effort must be multi-national because the problem is world-wide and because industrialized countries are exporting their technology to the developing world. It must be multi-industry because any particular hazardous chemical is often used in several different industries. It is highly multi-disciplinary, involving chemical engineering, atmospheric sciences, mathematics, toxicology, and a number of other disciplines. 11 refs., 1 tab.

53231 (BALUF-STS–87-06) **CS-137 in Austrian domestic animals: determination of transfer parameters and meat contamination by live animal measurements.** Henrich, E. Bundesanstalt fuer Lebensmitteluntersuchung und -forschung, Vienna (Austria). 19 Oct 1987. 11p. Order Number DE90604898. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Soon after the Chernobyl accident several programs were initiated by provincial and federal authorities to check the validity of transfer factors and biological lifetimes as given in the literature; to test the possibility of reducing the cesium content in meat and milk by chemical agents; and to determine the cesium content of meat in live animals to assist of slaughtering decisions. Details and results of these programs are presented. 1 tab., 3 figs., 9 refs.

53232 (CONF-8710458–) **Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation.** ENEA, Rome (Italy). Jul 1988. 456p. (In Italian French English). From Studies on environmental radioactivity and health impact with reference to Chernobyl accident meeting; Rome (Italy); 12-13 Oct 1987. Order Number DE89793223. Available from NTIS (US Sales Only), PC A20.

The studies deal with the following topics: Chernobyl fallout monitoring in the environment of Western Europe (in particular, measurements of cesium 134 and 137 ground and air contamination, cesium 137 and iodine 131 contamination of the food chain); whole body counting; methodology, accuracy and reliability of dose equivalent evaluations; the efficiency of the Italian national radiation monitoring network and national radiation protection measures; comparisons of the radiation protection policies of European nations; the planning, standardization and integration of European radiation monitoring networks; the drawing up of emergency plans to ensure adequate protection of the public, on an international level, against radiation hazards. Separate abstracts were prepared for 18 papers of this report.

53233 (CONF-8710458–, pp. 33-51) **Environmental radioactivity monitoring after Chernobyl in Italy.** Cigna, A.A. (ENEA, Saluggia (Italy)); Spezzano, P.; Dominici, G. ENEA, Rome (Italy). Jul 1988. (In Italian). From Studies on environmental radioactivity and health impact with reference to Chernobyl accident meeting; Rome (Italy); 12-13 Oct 1987. In *Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation.* Order Number DE89793139. Available from NTIS (US Sales Only), PC A20.

Environmental radioactivity (in particular, iodine 131 concentrations) measurements made, following the Chernobyl accident, by the Radiation Protection Division of the CCR Ispra (Italy) and by the health Physics Service of the CRE Saluggia ENEA (Italy), on samples collected in the north-western parts of Italy, are reported. The general structure of the environmental laboratories, the choice of samples and collection techniques are discussed in order to standardize the methodologies and make the measurements comparable.

53234 (CONF-8710458–, pp. 373-378) **Aerial monitoring of terrestrial radioactive contamination due to Chernobyl incident.** Bertocchi, A.; Frullani, S.; Mazzini, F.; Morichi, M.; Salusest, B. ENEA, Rome (Italy). Jul 1988. (In Italian). From Studies on environmental radioactivity and health impact with reference to Chernobyl accident meeting; Rome (Italy); 12-13 Oct 1987. In *Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French organizations of protection against radiation.* Order Number DE89793236. Available from NTIS (US Sales Only), PC A20.

A description is given of the aerial monitoring equipment and data acquisition system used to measure cesium 134 and 137 ground contamination in Italy in May 1986. The equipment (H.V. fed NaI(Tl) crystal scintillator, linear amplifier, analog-to-digital converter and a Le Croy 3500 minicomputer) and methodology adopted were chosen based on the experience gained by other countries in the monitoring of the contamination due to the uncontrolled re-entry of the COSMOS satellites in 1978 and 1983. The equipment was mounted with a special anti-vibration support structure on an Augusta-Bell AB412 helicopter. The aerial system was designed to monitor ground contamination over large areas, pinpoint individual sources in various locations scattered over vast areas and to take in-flight samples of radioactive clouds.

53235 (CONF-8710458–, pp. 415-419) **Radioecological consequences of Chernobyl: Review of radiation monitoring - civil defense activities in Italy.** Benassai, S. (ENEA, Rome (Italy)); Breuer, F.; Piermattei, S.; Susanna, A.; Trenta, G. ENEA, Rome (Italy). Jul 1988. (In Italian). From Studies on environmental radioactivity and health impact with reference to Chernobyl accident meeting; Rome (Italy); 12-13 Oct 1987. In *Studies on environmental*

radioactivity and health impact with reference to Chernobyl accident. Proceeding of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation. Order Number DE89793238. Available from NTIS (US Sales Only), PC A21/MF A01.

This paper comments on information provided by ENEA-DISP (Italian Nuclear Agency-Radiation Protection) which deals with the ecological and biological consequences of the Chernobyl accident in Italy. The measured contamination levels regard iodine 131 and cesium 137 concentrations in air, vegetables and milk. Equivalent dose estimates are given for population in the north, center and south of Italy. The accuracy of these measurements is reviewed and comparisons are made with values obtained in other countries. Suggestions are made, calling for the creation of an integrated emergency plan and stressing the need for improved modalities of information gathering, interpretation and dissemination on a national level.

53236 (CONF-8710458–, pp. 465-474) **Basis of measures (radiation protection) adopted by Italy following the Chernobyl accident.** Campos Venuti, G. (Ist. Superiore di Sanita', Rome (Italy)); Parisi, A.; Susanna, A. ENEA, Rome (Italy). Jul 1988. (In Italian). From Studies on environmental radioactivity and health impact with reference to Chernobyl accident meeting; Rome (Italy); 12-13 Oct 1987. In *Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation.* Order Number DE89793239. Available from NTIS (US Sales Only), PC A20.

This paper summarizes the radiation monitoring activities carried out and precautions taken in Italy immediately following the Chernobyl accident. Comments are made on the efficacy of the Italian monitoring system and on the accuracies of measurements of iodine 131, cesium 134 and 137 concentrations in air, milk, vegetables and forage. The methodology and accuracy of dose equivalent evaluation are also reviewed. The report cites the need for better organized national monitoring network employing standardized methods and equipment and on improved nationwide system of information gathering, interpretation and dissemination to the public.

53237 (DOE/EH–0107) **Assessment of environmental conditions at the Rocky Flats Plant, Golden, Colorado.** USDOE Special Assignment Environmental Team, Washington, DC (USA). Aug 1989. 478p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90000987. Available from NTIS, PC A21/MF A01 - OSTI; GPO Dep.

The Environmental Team has undertaken audit and sampling/monitoring activities to perform an assessment of environmental conditions at the Rocky Flats Plant (RFP). The assessment was conducted from June 6, through July 21, 1989. The objectives of these activities were to determine: whether or not any imminent threat exists to public health or the environment as a result of RFP activities; if RFP operations are being conducted in accordance with applicable environmental requirements and best management practices; and the current status of previously identified environmental problems. In addition, existing environmental management programs at RFP were evaluated. Weaknesses or gaps in the programs were identified and recommendations developed.

53238 (FS–89-50-AKU) **Recommendations for a revision of the Guideline on Emission and Environmental Impact Monitoring of Nuclear Facilities. Statement of the Working Group on Environmental Monitoring.** Fachverband fuer Strahlenschutz e.V. Publikationsreihe Fortschritte im Strahlenschutz. Narrog, J.; Heinemann, K.; Winter, M.; Herrnberger, V.; Haag, J.; Czerwinski, N. Fachverband fuer Strahlenschutz e.V., Karlsruhe (Germany, F.R.); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit. Jul 1989. 32p. (In German). Order Number DE90711754. Available from NTIS (US Sales Only), PC A03/MF A01.

The Guideline on Emission and Environmental Impact Monitoring of Nuclear Facilities (GMBl p. 668, Nov. 26, 1979), published ten years ago, mainly provides for plant related monitoring of the environment. It is analysed, whether or not the Guideline has proved its worth and which revisions should be recommended as a result of new findings, experiences and more recent developments. Although the Guideline as a whole has proved to be adequate and reasonable, a number of modifications seem to be appropriate, some of them even highly necessary. The appendix contains a comparison of essential dose factors 1979 and 1989. (orig./HP).

53239 (IAEA-AL–019, pp. 181-183) **Some of the activities of the Radiochemistry Section at the Atominstitute of the Austrian Universities related to rapid methods for monitoring radionuclides in food and environmental samples.** Buchtela, K. (Atominstitut der Oesterreichischen Universitaeten, Vienna (Austria)). International Atomic Energy Agency, Seibersdorf (Austria). Laboratories. 1989. (CONF-880992–: Cogeneration applications workshop, Vienna (Austria), 1-2 Sep 1988). In *Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988.* Order Number DE90603824. Available from NTIS (US Sales Only), PC A10/MF A01 - OSTI; INIS.

Monitoring radionuclides in food and environmental samples is part of the routine analysis programme since the implementation of the Radiochemistry Group at the Atominstitute in 1960. In the surrounding of the laboratories of the Atominstitute environmental radioassay had to be carried out even before any work with radionuclides had been started. Determination of radionuclides, gamma-spectrometry and strontium-90 determinations in food had been made from Austrian crops to be exported especially to the USSR.

53240 (KURRI-TR–316) **Papers presented at the intensive seminar on tree rings.** Noda, Masato (ed.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1989. 100p. (In Japanese). (CONF-8811269–: Intensive seminar on 'tree rings', Kumatori (Japan), 29-30 Nov 1988). Order Number DE90705931. Available from NTIS (US Sales Only), PC A05/MF A01.

This document compiles individual presentations given at the Intensive Seminar on Tree Rings held at Kumatori, Osaka on November 29 and 30, 1988.

53241 (LA-UR–89-3049) **Migration of fission products at the Nevada Test Site: Detection with an isotopic tracer.** Thompton, J.L.; Gilmore, J.S. Los Alamos National Lab., NM (USA). [1989]. 7p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-891120–1: Migration '89: 2nd international conference on chemistry and migration behavior of actinides and fission products in the geosphere, Monterey, CA (USA), 6-10 Nov 1989). Order Number DE90000601. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Researchers at Los Alamos National Laboratory are studying the migration of fission products away from explosion cavities formed by underground nuclear tests at the Nevada Test Site. In some cases, the isotopic composition of the fission products or activation products associated with a particular test are distinctive and we may identify them many years after the event. In this paper we describe a case in which we used rhodium isotopes to identify the source of radioactive material that had moved some 350 m from the explosion site. 4 refs., 2 figs., 2 tabs.

53242 (ORNL/FTR–2805) **[The effects of ionizing radiation on terrestrial and freshwater organisms]: Foreign trip report, January 15–23, 1988.** Blaylock, B.G. Oak Ridge National Lab., TN (USA). 4 Feb 1988. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017395. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler was invited by the International Atomic Energy Agency (IAEA) to attend an Advisory Group Meeting on "The Effects of Ionizing Radiation on Terrestrial and Freshwater Organisms and Ecosystems." The traveler and Dr. Ward F. Whicker of Colorado State University had prepared a draft document on the subject that was to be reviewed by the Advisory Group. The purpose of the document was to address the statement that by protecting humans with radiological standards, we are automatically protecting natural populations of terrestrial and aquatic organisms and ecosystems. In addition, the document was to include a review of the literature on the effects of radiation on terrestrial and aquatic organisms and populations. Recommendations of the Advisory

Group were that because of the abundance of reviews and methodologies for dose calculations for aquatic biota, with a few revisions, the section on aquatic biota would be complete. For the section on terrestrial biota, the Advisory Group recommended that the literature review include results of laboratory and domestic animal studies and that the dosimetry calculations be reviewed by other experts in the field. The Scientific Secretary concluded that the document would not be completed for at least one year because of the time required to complete the review on terrestrial biota.

53243 (ORNL/M–836) **Environmental surveillance data report for the first quarter of 1989.** Daniels, K.L.; Goldberg, P.Y.; Horwedel, B..; McCollough, I.L.; Osborne-Lee, A.E.; Tardiff, M.F.; Teeters, S.W.; Valentine, C.K.; Wear, C.J.; Wolf, D.A. Oak Ridge National Lab., TN (USA). Sep 1989. 134p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001275. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

During the first quarter of 1989, over 4100 samples, which represent more than 9100 analyses and measurements, were collected by the Environmental Monitoring and Compliance Section. A network of real-time monitoring stations that telemeter 10-min averaged readings of radiation levels, total precipitation, flows, water quality parameters, and air quality parameters around Oak Ridge National Laboratory (ORNL) also reported data. In addition, three meteorological towers sent weather data at various heights to a host computer every 15 min. The environmental monitoring program at ORNL was reviewed during this quarter and revisions are currently being implemented to reflect changing requirements and historical results.

53244 (ORNL/RASA–89/4) **Preliminary site survey report for the former Elza Gate warehouse area, Oak Ridge, Tennessee.** Cottrell, W.D.; Quillen, J.L.; Carrier, R.F. Oak Ridge National Lab., TN (USA). Sep 1989. 27p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE90001246. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the early 1940s, the operations of the Manhattan Engineer District (MED) in support of the war effort included the importation and refining of foreign uranium ore. The radium-bearing sludges that resulted from the refining process were stored in warehouses in Oak Ridge, Tennessee, while awaiting further disposition. Later on, other radioactive materials such as tailings, oxide residues, and slag were also stored in the five warehouses. Following the removal of the stored materials to other facilities, the Atomic Energy Commission's Y-12 Plant in Oak Ridge used the warehouses for a period of time before the site was decontaminated and released for unrestricted use under criteria current at that time. However, because guidelines for use of such sites have become more stringent since previous cleanups, and because it is the policy of DOE to verify that such sites are in compliance with current guidelines, a radiological survey was conducted on parcels 1–4 of the property by members of the Measurement Applications and Development Group of Oak Ridge National Laboratory in March 1989. Survey results show that widespread residual radioactivity from former operations remains on the property, primarily in outdoor soil and as surface contamination on three of the original concrete pads, one of which is inside the present building. Residuals are in excess of the DOE's criteria for cleanup under the Formerly Utilized Sites Remedial Action Program. Since results also indicate that spillover contamination to parcels 5–9 on the property is probable, further surveying of these areas may be appropriate. 4 refs., 7 figs., 9 tabs.

53245 (PB–89-209274/XAB) **Site characterization for radon source potential.** Yokel, F.Y. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Building Technology. Jun 1989. 59p. (NISTIR–89/4106). Available from NTIS, PC A04/MF A01.

Radon-source potential characterization of sites in terms of soil index properties which do not vary with transient conditions such as moisture content, barometric pressure, temperature and wind speed is studied. The invariant index properties which were found to be critical for site characterization are radium activity concentration in the soil, in-place dry density, porosity, and dry gas permeability. These properties can be measured in-situ or in the laboratory or estimated on the basis of other soil index properties such as grain-size distribution and Atterberg limits. Various expressions for radon source potential are reviewed and a new expression is formulated on the basis of data from areas of deep glacial terrace deposits. Site exploration methods proposed include use of the Standard Penetration Test together with a laboratory determination of radium activity concentration, and a rapid field measurement procedure using a portable gamma-ray spectrometer, a portable nuclear moisture-density meter and retrieval of a soil sample for laboratory determination of particle-size distribution. A plan to develop exploration protocols, test the effectiveness of the source potential prediction, and prepare a draft exploration standard is proposed.

53246 (EGG-CEMA–8510) **Soil classification of proposed NPR [New Production Reactor] sites at the Idaho National Engineering Laboratory.** Breckenridge, R.P.; McGrath, C.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). Center for Environmental Monitoring and Assessment. May 1989. 46p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89016215. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is currently being considered as one of three possible locations for the construction of a New Production Reactor (NPR). Two areas have been selected as possible sites for the NPR on the INEL. Prior to selecting the final NPR site, all sites must be characterized. This report classifies the soils of the two proposed NPR sites on the INEL. Soil scientists conducted this survey to classify the types of soils at the two proposed NPR sites. Prior to this study, no soil survey had ever been conducted which covered the proposed sites. However, soil surveys have been published for the surrounding Jefferson, Bonneville and Power counties. The subject survey compared characteristics of the soil profiles of the proposed sites with profiles that have previously been described elsewhere. In addition to the published surveys, a special soil survey was released for Butte County. However, this report primarily addressed the irrigability of soils in Butte County. Following classification of all major soil series at the sites, aerial photographs were used to help delineate the boundaries of each soil series. After the maps were completed, ground surveys were conducted to verify the mapped units. 4 refs., 2 figs., 7 tabs.

53247 (PB–89-188783/XAB) **Superfund Record of Decision (EPA Region 2): Marathon Battery, NY (second remedial action), September 1988 (re-announced).** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1988. 343p. (EPA/ROD/R–02-88/064). Available from NTIS, PC A15/MF A01.

RE-ANNOUNCED with different title. See also PB–87-190096.

The Marathon Battery Company (MBC) site, a former battery manufacturing plant, is located in the Village of Cold Spring in Putnam, New York, approximately 40 miles north of New York City. The site operated from 1952 to 1979 producing military and commercial batteries. During this time the site changed ownership several times, finally operating as the MBC from 1969 to 1979. Before 1965, the plant's waste-water treatment system discharged into the Hudson River at the Cold Spring pier via the Cold Spring sewer system, except during periods of overload or system shutdown during which time the process effluent was discharged directly into East Foundry Cove Marsh (EFCM) to the southeast. Between November 1972 and July 1973, a limited cleanup was conducted by MBC and other responsible parties, to remove sediment from parts of Foundry Cove and surrounding areas contaminated with cadmium and nickel in excess of 900 mg/kg. The selected remedial

action for Area II at this site includes: decontamination of the former battery facility; excavation; and offsite disposal.

53248 (PB–89-206031/XAB) **Applications analysis report: HAZCON solidification process, Douglassville, Pennsylvania.** Sawyer, S. Foster Wheeler Enviresponse, Inc., Livingston, NJ (USA). May 1989. 64p. Available from NTIS, PC A04/MF A01.

Also available from Supt. of Docs. See also PB–89-158810.

This document is an evaluation of the HAZCON solidification technology and its applicability as an on-site treatment method for waste-site cleanup. A demonstration was held at the Douglassville, Pennsylvania Superfund site in the fall of 1987. Operational data and sampling and analysis information were carefully monitored and controlled to establish a data base against which other available data and the vendor's claims for the technology could be compared and evaluated. Conclusions were reached concerning the technology's suitability for use in clean up of the types of materials found at the test site, and extrapolations were made to cleanups of other materials.

53249 (BR–82(11.105)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North and Mid-Atlantic): Tautog and cunner.** Auster, P.J. Connecticut Univ., Groton, CT (USA). Aug 1989. 14p. Sponsored by U.S. Department of Defense; U.S. Department of the Interior. (TR-EL–82-4/82(11.105)). Available from OSTI - US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Species profiles are summaries of literature on the taxonomy, morphology, range, life history, and environmental requirements of coastal finfishes and shellfishes. They are designed to assist in environmental impact assessment. Tautog (*Tautoga onitis*) and cunner (*Tautogolabrus adspersus*) are common coastally distributed species along the northeast US. Both species are active during the day and require shelter sites at night, when they are inactive. They also require overwintering shelter when torpid. Cunner are omnivorous, feeding on a variety of primarily benthic species; tautog feed primarily on mussels (*Mytilus edulis*). Tautog spawn from mid-May to mid-August and cunner from early May to late August. Longevity of cunner, the smaller of the two species, is 6 years and that of tautog, the larger species, is about 34 years. Due to their nocturnal and low-temperature inactivity, these species are unable to avoid short-term detrimental environmental disturbances. Since they undertake no long-distance migrations, they are key indicators of site-specific stress along the coast. 43 refs., 4 figs., 1 tab.

53250 (BR–82(11.106)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North Atlantic): Rainbow smelt.** Buckley, J. Massachusetts Univ., Amherst, MA (USA). Dept. of Forestry and Wildlife Management. Aug 1989. 12p. Sponsored by U.S. Department of the Interior. (TR-EL–82-4/82(11.106)). Available from OSTI - US Fish and Wildlife Services, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Species profiles are literature summaries of the taxonomy, life history, and environmental requirements of coastal fishes and aquatic invertebrates. They are designed to assist with environmental impact assessments. The rainbow smelt is an abundant forage fish for commercially and recreationally valuable fishes such as striped bass and bluefish on the East Coast and several species of salmon and trout in the Great Lakes. The rainbow smelt also supports an important sportfishery throughout most of its range. In 1976, the total smelt harvest in the coastal waters of New England was 105,000 lb. Coastal rainbow smelt are anadromous, spawning in freshwater and maturing in saline water. Spawning peaks in spring. Salinities above 12 ppt were fatal to eggs. Reported fecundities are 7,000 to 44,000 eggs per female. Smelt are always found in shallow water (<6 m deep) and within 2 km of the shore. Larval and juvenile smelt along the coast feed on planktonic crustaceans. Larger juveniles and adults feed on euphausiids, amphipods, on planktonic crustaceans. Larger juveniles and adults feed on euphausiids, amphipods, polychaetes, and fish. Smelt move locally to search for optimum water temperatures. 46 refs., 2 figs., 1 tab.

53251 (BR–82(11.108)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Atlantic menhaden.** Rogers, S.G.; Van Den Avyle, M.J. Georgia Univ., Athens, GA (USA). Georgia Cooperative Fishery Research Unit. Aug 1989. 24p. Sponsored by U.S. Department of the Interior. (TR-EL–82-4/82(11.108)). Available from OSTI - US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Species profiles are literature summaries of the life history, distribution and environmental requirements of coastal fishes and invertebrates. Profiles are prepared to assist with environmental impact assessment. The Atlantic menhaden (Brevoortia tyrannus) is an important commercial fish along the Atlantic coast. In the South Atlantic Region, Atlantic menhaden spawn during winter in continental shelf waters. Adults then move inshore and northward in spring; some move into estuaries as far as the brackish-freshwater boundary. Atlantic menhaden larvae in the South Atlantic Region enter estuaries after 1 to 3 months at sea. Young fish move into the shallow regions of estuaries and seem to prefer vegetated marsh habitats. Atlantic menhaden are size-selective plankton feeders as larvae, and filter feeders as juveniles and adults. Due to their large population size, individual growth rates, and seasonal movements, Atlantic menhaden annually consume and redistribute large amounts of energy and materials. They are also important prey for large game fishes such as bluefish (Pomatomus saltatrix), striped bass (Morone saxatilis), and bluefin tuna (Thunnus thynnus). The Atlantic menhaden is associated with estuarine and nearshore systems during all phases of its life cycle. Young menhaden require these food-rich habitats to survive and grown. Destruction of estuarine wetlands has decreased nursery habitat available to Atlantic menhaden and other estuarine wetlands has decreased nursery habitat available to Atlantic menhaden and other estuarine-dependent species. 115 refs., 2 figs., 2 tabs.

53252 (BR–82(11.109)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Weakfish.** Mercer, L.P. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA); National Wetlands Research Center, Slidell, LA (USA); North Carolina Div. of Marine Fisheries, Morehead City, NC (USA). Aug 1989. 17p. Sponsored by U.S. Department of the Interior. (TR-EL–82-4/82(11.109)). Available from OSTI; US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Species profiles are literature summaries of the taxonomy, morphology, range, life, history, and environmental requirements of coastal aquatic species. They are designed to assist in environmental impact assessment. Weakfish are one of the most abundant fishes in the estuarine and nearshore waters of the Atlantic coast. Weakfish mature at age I throughout their range and spawning takes place in coastal and estuarine waters from March to September. Juveniles utilize the deeper areas within estuarine as nursery grounds, migrate from high to low salinity areas throughout the summer, return to high salinity areas in fall, and most leave the estuaries by late fall. Some may remain in estuarine and nearshore coastal waters in winter, particularly in southern areas. Adult weakfish migrate seasonally, north in spring and south in fall between inshore and offshore waters. Growth rates, maximum size, and longevity of weakfish are higher at the northern end of the range. Weakfish are an important recreational and commercial species in the Mid-Atlantic. Weakfish feed predominately on mysid shrimp and anchovies as juveniles, and on clupeids and anchovies as adults. Weakfish have been found over a temperature range of 9.5 to 30.8 °C. Juvenile weakfish have been found over a wider salinity range (0.1–31.7 ppt) than adults (6.6–32.3 ppt). 72 refs., 5 figs., 5 tabs.

53253 (BR–82(11.110)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (south Florida): Black, red, and Nassau groupers.** Jory, D.E.; Iversen, E.S. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA); National Wetlands Research Center, Slidell, LA

(USA); Miami Univ., FL (USA). Rosenstiel School of Marine and Atmospheric Sciences. Aug 1989. 21p. Sponsored by U.S. Department of the Interior. (TR-EL-82-4/82(11.110)). Available from OSTI; US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Blvd., Slidell, LA 70458.

Black, red, and Nassau groupers (Mycteroperca bonaci, Epinephelus morio, and E. striatus, respectively) are widely distributed on rocky bottoms and reefs along the south Florida coast. They are the most valuable marine finfish group in Florida, comprising about 25% of the total value of landings in 1984. The three species can be distinguished by morphometric, meristic, and body color characteristics. Younger fish are typically found in shallow, inshore grass beds, and larger, older fish are generally restricted to deep waters. The three species are protogynous hermaphrodites. Sexual transition can occur at any length over about 300 mm SL. An offshore movement apparently coincides with the onset of sexual maturity. Spawning aggregations have been observed throughout the year, but occur mostly between late spring and early summer. Fecundity estimates range from about 800,000 to 5,000,000 eggs per female. Both the eggs and the larvae are planktonic. Their early life history is poorly known. Larvae probably leave the plankton and become benthic at around 20–30 mm SL. Growth rates range from about 2 to 10 mm/month. The three species are unspecialized carnivores, feeding on a variety of fishes, crustaceans, and mollusks. Interspecific competition for food and shelter may be common because of the overlap in distribution, habitat, size, and food habitats. For the three species, a number of predators and parasites have been reported. Both the black and red groupers have been implicated in ciguatera poisonings in south Florida. 70 refs., 3 figs., 3 tabs.

53254 (BR-82-(11.112)) **Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Summer and winter flounder.** Grimes, B.H.; Huish, M.T.; Kerby, J.H.; Moran, D. Fish and Wildlife Service, Raleigh, NC (USA). North Carolina Cooperative Wildlife and Fishery and Research Unit; National Wetlands Research Center, Slidell, LA (USA). Aug 1989. 19p. Sponsored by U.S. Department of Defense; U.S. Department of the Interior. (TR-EL-82-4/82(11.112)). Available from OSTI - US Fish and Wildlife Service, NASA-Slidell Computer Complex, 1010 Gause Boulevard, Slidell, LA 70458.

Species profiles are literature summaries of the taxonomy, morphology, range, life history, and environmental requirements of coastal species. They are designed to assist in environmental impact assessments. The summer flounder supports an important commercial and recreational fishery in the Mid-Atlantic and are important constituent of estuarine and continental shelf systems throughout the region. Summer flounder spawning begins in September and winter flounder spawning begins in June. Summer flounder eggs are pelagic whereas winter flounder eggs are demersal. Summer flounder larvae are more abundant in inlets, and juveniles are found in estuarine seagrass beds in salinities { >=} 12 ppt. Winter flounder juveniles are abundant in shallow bays and estuaries, moving seaward in spring and summer. Growth of winter flounder and summer flounder is seasonal. There are probably three spawning populations of both species which produce a complex stock pattern. Summer flounder are tolerant of a wide range of chemical and physica faactors, but prefer >10 ppt salinities. Winter flounder optimal temperature is 18.5 °C. Diseases of winter flounder are more prevalent in polluted waters. Summer flounder are tolerant of sediments laden with contaminants. 64 refs., 5 figs., 2 tabs.

53255 (AD-A-208915/9/XAB) **Theoretical models for evaluation of volatile emissions to air during dredged-material disposal with applications to New Bedford Harbor, Massachusetts. Final report, July 1987-June 1988.** Thibodeaux, L.J. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. May 1989. 58p. (WES/MP/EL-89-3). Available from NTIS, PC A04/MF A01.

Some bottom sediments in both fresh and marine waters are contaminated with hazardous organic chemicals that are classified as volatile and semivolatile. An example is the New Bedford Harbor and Acushnet River Estuary sediment, which contains quantities of the polychlorinated biphenyls Aroclors 1242, 1248, and 1254. Dredged material contaminated with these and other volatile organic chemicals (VOCs) can release these contaminants to the atmosphere during and after disposal by volatilization. Methods to predict these volatilization losses are needed to develop design, operation, and management guidelines for controlling VOC emissions. Volatilization rates for hydrophobic organic compounds from a confined disposal facility (CDF) containing contaminated dredged material are presently unknown. The primary purpose of this study was to assess the availability of theoretical models for the evaluation of volatile emissions to air during the process of dredged-material disposal in a CDF. The first objective was to identify the primary vapor phase transport mechanism for various CDF designs and stages of filling. This provided the theoretical basis for assessing relative volatilization rates. The second objective was to review available laboratory and field procedures for obtaining the information needed to measure volatile losses. The report also contains preliminary calculations of the emission rates of Aroclors 1242 and 1254 from a hypothetical CDF operation in the Upper Acushnet River Estuary (Appendix A). Appendix B presents a detailed derivation of the rivulet and ponded VOC emission model.

53256 (CONF-891042-2) **Characterization of the ORNL [Oak Ridge National Laboratory] Biology Area process wastewater.** Armento, W.J.; Stephens, L.A.; Haught, C.F.; Blaise, D.E. Oak Ridge National Lab., TN (USA). 1989. 27p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 31. ORNL/DOE conference on analytical chemistry in energy technology; Gatlinburg, TN (USA); 10-12 Oct 1989. Order Number DE90001333. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In order for proper treatment of the Biology Area process wastewater to be affected and that a Federal Facilities Compliance Agreement (FFCA) be met at the Y-12 Plant, both flow rates and potential wastewater-contained pollutants were measured. A two-phase sampling-and-analysis program determined that the only detrimental constituent in the wastewater is residual chlorine. In addition, flow-rate measurements indicated that the Biology Area discharge rates were decreasing with time as the Biology Division implemented a strict schedule for reducing its effluent flow rates and total pollutant loadings. As a result, the capital costs and potential annual operating costs were greatly reduced (by as much as $1 million and $750,000, respectively) by demonstrating that the Biology Area process wastewater could be sent to the City of Oak Ridge Wastewater Treatment Facility. A special treatment plant, to be built at the Y-12 Plant, would not be needed. Because of the presence of residual chlorine in the wastewater, the fragility of the wastewater solutions was tested over periods of 1 or 2 d to determine the best method of preserving the samples so that loss of the residual chlorine would be minimized. Refrigeration of the samples for as long as 8 h was found to be satisfactory; loss of residual chlorine in the wastewater was almost undetectable under these conditions. 17 figs., 3 tabs.

53257 (DOE/BC/14304-T4) **The Louisiana Department of Natural Resources, Office of Conservation, Injection and Mining Division underground injection control program: A peer review.** Underground Injection Practices Council, Oklahoma City, OK (USA). 1989. 132p. Sponsored by U.S. DOE Fossil Energy. DOE Contract FG22-89BC14304. Order Number DE90001544. Available from NTIS, PC A07/MF A01 - OSTI.

The reports included herein and any reports added subsequently are the result of an effort to evaluate the effectiveness of state programs to protect Underground Sources of Drinking Water (USDW) from potential contamination resulting from the operation of injection wells related to the production of oil and gas (Class II injection wells). A USDW is defined as an aquifer or its portion which supplies a public water system, or which contains sufficient water to supply a public water system, and currently supplies drinking water for human consumption, or contains a concentration of less than 10,000 mg/l total dissolved solids (TDS) and which is not otherwise exempted as a USDW. Where defined waters other than USDWs exist and where they are addressed in the state program, they are

highlighted in the General Program Comments and Observations portion of the report. Readers will need to exercise care when using individual state reports to understand specific relationships between USDWs and any waters with a more limited definition. The Review Team's conclusions are in every case based on protection of USDWs. The programs examined in this study cover wells which are used for the injection of fluids into oil reservoirs for the purpose of stimulating or furthering their production when natural production mechanisms decline or cease (enhanced recovery wells) and for the disposal of waters produced in conjunction with the production of oil and gas (disposal wells).

53258 (GKSS–89/E/15) **X-ray diffraction and chemical examination of suspended particulates from the Elbe river.** Koopmann, C. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); Hamburg Univ. (Germany, F.R.). Fachbereich Geowissenschaften. 1989. 103p. (In German). Order Number DE90711709. Available from NTIS (US Sales Only), PC A06/MF A01.

The behaviour of suspended matter and trace elements in an estuary depends on the individual conditions and is strongly influenced by the complex hydrodynamic processes. These processes are characterized by spatial and temporal variations. In order to quantify the variability in the Elbe estuary two experiments were carried out in the lower section of the Elbe (summer 1985, spring 1986). Water samples were taken at three anchor stations in three water depths during four characteristic tidal phases. The composition of the suspended matter was determined and a qualitative and quantitative mineral analysis was carried out. A difference was made between dissolved and particulate forms of trace elements. Particulate trace element and organic carbon contents were determined both in unfractionated and fractionated suspended matter samples. The results gave evidence for different binding sites of the elements. The experiments covered two extreme situations, which reflect an essential part of the natural variations of the estuarine hydrodynamics and by this a considerable portion of the mineralogical, chemical and hydrographic parameter varations. (orig.) With 42 figs, 18 tabs.

53259 (ORNL/FTR–2498) **[Man-made radionuclides as tracers for biogeochemical and limnological processes]: Foreign trip report, February 4–24, 1987.** Olsen, C.R. Oak Ridge National Lab., TN (USA). 9 Mar 1987. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017355. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

C.R. Olsen attended the 23rd SIL Congress and was asked to chair a session on man-made radionuclides as tracers for biogeochemical and limnological processes at the next Congress in Munich in 1989. The traveler presented his results on the use of radionuclides to quantify contaminant sorption kinetics and water-column removal rates at the IASW Symposium. Numerous discussions with several European scientists provided valuable information concerning the environmental fate of radionuclides released during the recent accident at Chernobyl. The traveler developed contacts with Swedish scientists involved in quantifying the effects of sediment resuspension on nutrient cycles. At the University of Melbourne, scientists have developed a new nuclear technique for reconstructing paleotemperatures and aiding in oil exploration.

53260 (PB–89-197156/XAB) **In-situ bioreclamation of contaminated ground water.** Rittmann, B.E.; Valocchi, A.J.; Odencrantz, J.E.; Bae, W. Illinois Univ., Urbana, IL (USA). Dept. of Civil Engineering. Nov 1988. 137p. Available from NTIS, PC A07/MF A01.

The report summarizes the results of a research project aimed at developing a better mechanistic understanding of the phenomena controlling in situ biological activity. A methodology involving laboratory-column experiments and computer modeling was utilized to investigate the formation of biologically active zones (BAZs) when a limiting electron acceptor (NO_3^-) is injected along the flow path and the secondary utilization of trace-level pollutants contained in the water flowing through the BAZ.

53261 (PB–89-197453/XAB) **Economics of sample compositing as a screening tool in ground-water-quality monitoring.** Rajagopal, R.; Williams, L.R. Environmental Protection Agency, Las Vegas, NV (USA). Environmental Monitoring Systems Lab. 1989. 10p. (EPA–600/J-89/044). Available from NTIS, PC A02/MF A01.

Pub. in GWMR, 186-192(1989).

Recent advances in high throughput/automated compositing with robotics/field-screening methods offer seldom-tapped opportunities for achieving cost reduction in ground-water-quality monitoring programs. An economic framework is presented for the evaluation of sample compositing as a screening tool in ground-water-quality monitoring. When the likelihood of occurrence of a contaminant in a well is very small, the use of sample compositing instead of routine exhaustive sampling will lead to reduction in analytical efforts. Such reduction will be maximum when there are no contaminated wells in the network. An N-fold reduction will result when none of the wells in a network of N wells are contaminated. When 25% or more wells in a network are contaminated, the use of sample compositing will require, at the most, an additional 50% analytical effort compared to exhaustive sampling. A quantitative ratio (fl) of laboratory analytical cost to that of well installation and field sampling costs and a ratio (f2) of the expected number of contaminated wells to that of the total number of wells were determined. Several useful mathematical results of primary interest are derived and illustrated with case examples in the paper. Selected areas for further research are also outlined.

53262 (PB–89-198246/XAB) **Direct/Delayed Response Project: Definition of soil-sampling classes and selection of sampling sites for the Northeast.** Lee, J.J.; Marmorek, D.R.; Thornton, K.W.; Stevens, D.L.; Lammers, D.A. Environmental Protection Agency, Corvallis, OR (USA). Environmental Research Lab. Apr 1989. 107p. (EPA–600/3-89/041). Available from NTIS, PC A06/MF A01.

The Direct/Delayed Response Project (DDRP) was designed and implemented to estimate the number of lakes and streams that might become acidic in three regions due to current or altered levels of acidic deposition. As part of DDRP, 145 watersheds in the northeast US were mapped at 1:24,000 for soils, vegetation, depth to bedrock, and bedrock geology. About 600 soils were identified during mapping. These were grouped into 38 soil-sampling classes. Each of these was sampled about 8 times across the region, so that regional means and standard deviations of soil properties could be computed for each class. The regional soil data will be used with the soil maps to estimate soil properties for each watershed. The watershed estimates will be used in the array of DDRP models to estimate future effects of acidic deposition on lakes in the northeast. The sampling classes were developed at a workshop held in Corvallis, Oregon July 16-18, 1985. This report documents the process and decisions of the workshop.

53263 (PB–89-204432/XAB) **North Carolina sanitary landfills: Leachate generation, management, and water-quality impacts.** Borden, R.C.; Yanoschak, T.M. North Carolina Water Resources Research Inst., Raleigh, NC (USA). Mar 1989. 66p. (UNC-WRRI–89-243). Available from NTIS, PC A04/MF A01.

The most widely used method of solid-waste disposal in North Carolina is burial in unlined municipally operated sanitary landfills (SLFs). A statistical analysis of existing surface- and ground-water monitoring data from 71 municipal sanitary landfills was performed to assess the impact of North Carolina SLFs on surface- and ground-water quality. A total of 322 surface and 411 ground-water quality records was analyzed using the SAS data system. Almost all the landfill records included inorganic and heavy-metal analyses, while approximately half of the records also include organic scans by GC/MS. Ground-water quality violations were detected for organic or inorganic pollutants at 53% of the landfills examined with adequate monitoring data. The severity of ground-water contamination at SLFs appears to be highly variable. At many of the landfills with ground-water quality problems, a 50% reduction in pollutant concentration would eliminate all violations. At a few isolated landfills, extremely high concentration of organic and inorganic pollutants has been detected. At these landfills, greater than 99.99% reductions would be required to meet existing standards. The results suggests that: most landfills do contaminate groundwater; the severity of contamination is highly variable; and the existing monitoring program is reasonably effective at detecting widespread trends.

53264 (PB–89-204440/XAB) **Distribution and mobilization of arsenic and antimony species in the Coeur d'Alene River system. Research report (Technical).** Wai, C.M.; Mok, W.M. Idaho Univ., Moscow, ID (USA). Water Resources Research Inst. May 1989. 64p. Available from NTIS, PC A04/MF A01.

The mining industry along the South Fork of the Coeur d'Alene River in northern Idaho is a major producer of silver, lead, and zinc in the United States. Mining operations in the past have discharged huge amounts of mining wastes into the South Fork of the river causing a serious pollution problem for the Coeur d'Alene River system. Sediments in the South Fork and the main stem of the river are contaminated with arsenic(As), antimony(Sb), cadmium(Cd), lead(Pb), zinc(Zn), and other metals. Leaching of As and Sb from the sediments along the main stem depends on the pH of the water and on the iron and manganese content of the sediments. The releases of As and Sb from the sediments appear to associate with the free iron oxides and manganese oxides in the sediments. However, releases of sediment Sb were generally found linear with respect to time while asymptotic limits on As releases were reached. Significant amounts of Zn, Fe, and Mn were also released during leaching, but Cu, Cd, Pb, and Ni were much less leachable. According to the study, interaction of water with the existing sediments is likely to be a major factor controlling the water quality of the Coeur d'Alene River.

53265 (PB–89-206767/XAB) **Evaluation of candidate measures of biological effects for the National Status and Trends Program. Technical memo. February 1987-April 1989 (Final).** Long, E.R.; Buchman, M.F. National Ocean Service, Rockville, MD (USA). Office of Oceanography and Marine Assessment. Apr 1989. 187p. (NOAA/TM/NOS/OMA–45). Available from NTIS, PC A09/MF A01.

Errata sheet inserted.

An evaluation of candidate measures of biological effects to a range in contaminant concentrations was performed in the San Francisco Bay area in 1987. The evaluation was performed to determine which of the candidate measures may be useful in the National Status and Trends (NS&T) Program. The evaluation included biological tests of sediments and fish. It was presumed that the biological tests most applicable to the NS&T Program would be those that were able to indicate differences among sampling locations over a range in chemical contamination and/or between sampling locations and laboratory controls, that had relatively large ranges in response among mean values for the sampling locations, that presented relatively small analytical errors, and that indicated patterns in biological response that generally paralleled the pattern in chemical contamination.

53266 (PB–89-207351/XAB) **Comparison of methods to determine oxygen demand for bioremediation of a fuel-contaminated aquifer.** Powell, R.M.; Callaway, R.W.; Michalowski, J.T.; Vandegrift, S.A.; White, M.V. Northrop Services, Inc./Environmental Sciences, Ada, OK (USA). 1988. 13p. Available from NTIS, PC A03/MF A01.

Pub. in International Jnl. of Environmental Analytical Chemistry, Vol. 34, No. 3, 253-263(Sep 1988).

Four analytical methods were compared for estimating concentrations of fuel contaminants in subsurface core samples. The methods were total organic carbon, chemical oxygen demand, oil and grease, and a solvent extraction of fuel hydrocarbons combined with a gas chromatographic technique. Presently the most applicable and convenient technique, based on greatest apparent contaminant recovery, is the solvent-extraction gas-chromatographic method. Sample heterogeneity and opportunity for losses due to contaminant volatility require considerations during sample handling, analysis, and when interpreting analytical data.

53267 (PB–89-208912/XAB) **Scheme for the direct analysis of organics in the environment by tandem mass spectrometry.** Hunt, D.F.; Shabanowitz, J.; Harvey, T.M.; Coates, M. Virginia Univ., Charlottesville, VA (USA). Dept. of Chemistry. 1985. 15p. Available from NTIS, PC A03/MF A01.

Pub. in Analytical Chemistry, Vol. 57, No. 2, 525-537(Feb 1985).

Direct analysis of hazardous organic chemicals in the environment by tandem mass spectrometry is described. Liquid and solid chemical wastes and residues from lyophilized aqueous solutions are volatilized directly into the ion source of a triple quadrupole instrument. All or most wet chemical and chromatographic separation steps are eliminated. Analysis of phthalates, aromatic hydrocarbons, chlorocarbons, phenols, amines, and carboxylic acids by functional group and molecular weight is accomplished by using the technique of collision-activated dissociation and a series of 0.5-s neutral loss and parent ion scans under data system control on a triple quadrupole instrument. Both knowns and unknowns are characterized, detection limits are at the 10-100 ppb level, and the total analysis time per sample is typically only 25-30 min.

53268 (PB–89-214985/XAB) **Quality-assurance data for routine water analysis in the National Water-Quality Laboratory of the US Geological Survey for water year 1987. Water-Resources Investigation.** Lucey, K.J.; Peart, D.B. Geological Survey, Denver, CO (USA). Water Resources Div. 1989. 98p. (USGS/WRIR–89-4049). Available from NTIS, PC A05/MF A01.

Also available from Supt. of Docs.

The U.S. Geological Survey maintains a quality-assurance program based on the analysis of reference samples for its National Water-Quality Laboratory located in Denver, Colorado. Reference samples containing selected inorganic constituents are prepared at the Survey's Water Quality Services Unit in Ocala, Florida, disguised as routine samples, and sent daily or weekly, as appropriate, to the laboratory through other Survey offices. Nutrient samples and precipitation samples also were submitted as samples of unknown concentration. The results are stored permanently in the National Water Data Storage and Retrieval System (WATSTORE), the Survey's data base for all water data. These data are analyzed statistically for precision and bias. The results of these statistical analyses are discussed for data collected during water-year 1987.

53269 (PB–89-215412/XAB) **Needs survey report to Congress: 1988 assessment of needed publicly owned wastewater treatment facilities in the United States. Data file.** Hudson, J.; Cooper, R.; Czado, T. Environmental Protection Agency, Washington, DC (USA). Municipal Facilities Div. 1 Jan 1988. mag ta Available from NTISCP T03.

See also PB–85-172690. Source tape is in the EBCDIC character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. For price at 6250 bpi density, call NTIS Computer Products. Price includes documentation, PB–89-189633.

The data tape includes cost estimates for waste-water treatment facilities and State supplied technical data. These data were used to produce the 1988 Needs Survey Report to Congress. The data on the tape were collected through 'IHS', in-house software where States perform direct on-line data updates.

53270 (PB–89-217962/XAB) **Coeur d'Alene basin EPA (Environmental Protection Agency) water quality monitoring, 1972-1986.** Hornig, C.E.; Terpening, D.A.; Bogue, M.W. Environmental Protection Agency, Seattle, WA (USA). Sep 1988. 40p. (EPA–910/9-88/216). Available from NTIS, PC A03/MF A01.

See also PB–86-153640.

Region 10, U.S. EPA, has conducted chemical and biological monitoring during low-flow conditions from 1972 to 1986 along the South Fork Coeur d'Alene River in northern Idaho, a stream with a long history of severe metals pollution from mining activities. During 1986, metals analysis of sediments and tissues from the lower Coeur d'Alene River and Coeur d'Alene Lake was also conducted. Due chiefly to effluent controls at the Bunker Hill Complex Superfund site, concentrations of zinc, cadmium, and lead were reduced since the 1970's. Although levels of zinc and cadmium remain well above national criteria for protection of cold water biota, recovery of aquatic life has been substantial, with the lower mainstream now supporting a successful sports fishery. Sediments in the lower Coeur d'Alene system remain heavily contaminated with toxic metals, although high levels in edible fish tissues were not found. Allowable permit limits (as of 1986) for metals (primarily cadmium) have the potential of increasing in-stream metals concentrations. Water quality-based permits are particularly important for aquatic life protection of the South Fork upstream of Mullan and the mainstream downstream of the S.F. confluence.

53271 (PB–89-867295/XAB) **Waste-water treatment: Ozonation processes and equipment. January 1977-July 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 158p. Available from NTISPC N01/MF N01.

Supersedes PB–88-867122.

This bibliography contains citations concerning the utilization of ozonation processes for waste-water disinfection. Topics include system descriptions and evaluations, comparisons with the chlorination process, reaction kinetics, and the use of the process in combination with other waste-water treatment methods. The treatment of organic and inorganic compounds in waste-water and municipal-water supplies is discussed. (This updated bibliography contains 292 citations, 37 of which are new entries to the previous edition.)

53272 (PB–89-867477/XAB) **Activated-sludge process: Waste treatment. January 1985-July 1989 (Citations from the Biobusiness data base). Report for January 1985-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 76p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the use of the activated sludge process in waste and waste-water treatment. Biochemistry of the activated sludge process, the effects of various pollutants on process activity, effects of environmental variables such as oxygen and water levels, nutrient requirements of microorganisms employed in activated-sludge processes, and the application of the process to specific wastes such as pharmaceuticals, halocarbons, metallic wastes, dairy wastes, coke-plant waste waters, and petrochemical effluents are among the topics discussed. Operating experiences at large plants are included. (Contains 154 citations fully indexed and including a title list.)

53273 (PNL-SA–16636) **Amphipod bioassay of selected sediments from Sequim Bay, Washington.** Ramsdell, K.A.; Strand, J.A.; Cullinan, V. I. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. (CONF-8909128–2: Oceans '89 conference, Seattle, WA (USA), 18-21 Sep 1989). Order Number DE90001390. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Amphipod bioassays performed during reconnaissance surveys of Sequim Bay in 1983–1984 for the US Environmental Protection Agency suggested possible sediment toxicity at three sites. These findings were not supported by other biological analyses and tests (dominant infauna, oyster larvae test) nor by the finding of relatively low levels of priority pollutants. In 1988, a re-examination of the 1983–1984 sites demonstrated that the Sequim Bay sediments were clearly nontoxic. Mean survivorship ranged from 89 to 100%. It was hypothesized that earlier indications of toxicity may have been due to a relatively high percentage of fines ($\geq$80%) and/or a relatively low interstitial salinity (24%) encountered at one or more of the 1983–1984 sites. The continued use of Sequim Bay as both a reference bay and a source of control sediment in future marine research is recommended. 13 refs., 5 figs., 3 tabs.

53274 (AERE-R–13393) **Interlaboratory study of sampling and characterisation techniques for groundwater colloids.** Longworth, G.; Ivanovich, M.; Ross, C.A.M.; Degueldre, C. UKAEA Harwell Lab. (UK). Nuclear Physics and Instrumentation Div. Feb 1989. 27p. Available from H.M. Stationery Office, London, price Pound 10.00.

Natural colloids may be important in the transport of radionuclides in groundwater and could significantly affect any analysis of repository safety. This report presents the results of an intercomparison exercise on techniques for sampling and characterisation of natural groundwater colloids. In this study a comparison was made of colloid populations, composition and size distributions in colloid concentrate samples taken in the field, of a poorly mineralised groundwater abstracted from fractured Permo-Triassic sandstone in the English East Midlands. A comparison was made of two methods; pulsed cross-flow ultrafiltration and tangential flow ultrafiltration. The actinide isotopic activities associated with the colloids were also determined, using isotope dilution/alpha spectrometry, at Harwell. The results from this intercomparison exercise indicate that: (i) no artefacts are produced by either colloid concentration method, although some aggregation of colloidal particles may occur on storage of aqueous colloid concentrates, (ii) good agreement on colloid populations and size distributions is obtained by different laboratories applying scanning electron microscopic analysis to cross-flow ultrafilters and (iii) no evidence was found for a significant change in colloid concentration or actinide loading after the groundwater had been stored in platinised aluminium barrels for $\sim$ 6 months. (author).

53275 (ENEA-RT-PAS–85-19) **Low levels of tritium and trace elements in autopsy tissue: Analytical methods.** Belloni, P.; Clemente, G.F.; Di Pietro, S.; Ingrao, G. ENEA, Casaccia (Italy). Dipt. Protezione Ambientale e Salute dell'Uomo. Feb 1985. 18p. (In Italian). Order Number DE89761996. Available from NTIS (US Sales Only), PC A03/MF A01.

Measurements of the equilibrium environmental tritium levels in the various components of the ecosystem are necessary to formulate realistic models for the physical dispersion and the ecological behavior of tritium following a release into the environment. Average tritium levels in environmental samples (air, rain, snow, surface water) in diets and biological samples (urine, blood) are reported in this paper. Preliminary data on tritium levels in human tissues are also given.

53276 (IPPJ-REV–3, pp. 32-38) **Tritium concentrations in natural waters in Japan before use of a large quantity of tritium on its fusion program.** Kaji, Toshio (Kyushu Univ., Fukuoka (Japan). Radioisotope Center); Momoshima, Noriyuki; Takashima, Yoshimasa. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

To clarify environmental tritium levels in Japan before use of a large quantity of tritium on its fusion program, the authors analyzed the tritium concentrations in various water samples, such as rain, river, lake, coastal sea and deep sea waters in Japan. The tritium concentrations in rain water were high at higher latitude. The definite differences of the tritium concentrations due to the weather conditions or seasons were not observed. The average tritium concentration in river water was 51.5 pCi/l in 1982 and that in lake water was 63.5 pCi/l in 1983. The vertical profiles of the tritium concentrations in the representative lakes were almost homogeneous except surface water. The average tritium concentrations in coastal seawater were about 20 pCi/l in both 1982 and 1983. The tendency of the increased tritium level with latitude as reported in literature was not observed by these experiments. Tritium levels in natural water in small isolated islands were lower than those at other places. In the Japan Sea, it was recognized that tritium was distributed down to around 2000 m in depth. This means that the more active vertical mixing of water masses than that in the Pacific Ocean is taking place. (author).

53277 (PB–89-198097/XAB) **Biogeochemistry of (210)Pb and (210)Po in fresh waters and sediments. Doctoral thesis.** Benoit, G. Woods Hole Oceanographic Institution, MA (USA). Jun 1988. 299p. (WHOI–88-26). Available from NTIS, PC A13/MF A01.

The geochemical cycling of (210)Pb in a Massachusetts lake was studied. A mass balance for the epilimnion showed that (210)Pb inputs by precipitation were matched by outputs on settling particles, so direct uptake by bottom sediments was inconsequential. Below the epilimnion, vertical mixing was very low because of a steep temperature/density gradient, and this limited vertical transport. Anoxic conditions caused remobilization of iron and (210)Pb, which reprecipitated at the oxycline and returned to the bottom via settling. Below the zone of precipitation, (210)Pb and iron distributions resulted from constant release from anoxic sediments and dilution in

the water column. Sediment (210)Pb distributions were caused by sedimentation and Fickian transport. The Fickian component was equal to the pore water diffusive flux. In pore waters, (210)Pb and (210)Po were 100 times greater that in overlying water and had steep concentration gradients, unlike Fe, Mn, S(-II), and alkalinity. (210)Pb partition coefficients decreased from 15000 to 1500 with depth controlled by sorption on iron oxides. Remobilization to the water column comes from a thin layer of iron-rich floc near the sediment/water interface. Deeper in the cores, diffusive transport can cause redistribution of (210)Pb to an extent that can affect (210)Pb dating.

53278 (PB–89-203913/XAB) **Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report.** Casso, S.A.; Clarke, W.R.; Livingston, H.D.; Palmieri, J.M.; Surprenant, L.D. Woods Hole Oceanographic Institution, MA (USA). Apr 1988. 53p. (WHOI–88-8). Available from NTIS, PC A04/MF A01.

The report contains (137)Cs and (90)Sr data from seawater samples collected on four cruises in the northwestern North Atlantic, Arctic Ocean, and Barents Sea during 1981 to 1985, and radionuclide data (137)Cs, (90)Sr and (239)Pu from samples collected on a cruise to the Norwegian-Greenland Seas in 1979. Also included are data from four ice stations in the Arctic from 1979 to 1985. The sample collections were made possible through collaborative efforts with several laboratories. The radionuclide analyses were done at the Woods Hole Oceanographic Institution.

53279 (CEGB-RD/L–3303/R88) **Status of projects using reject heat for aquaculture and horticulture at power plants in the EEC.** Aston, R.J. Central Electricity Research Labs., Leatherhead (UK). Aug 1988. 24p. Order Number DE90606539. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Data collected mainly from an inventory of waste heat projects in the EEC prepared by Potentiel Energie of Paris covers 46 projects approximately half of which are fish farms and half horticultural projects mainly in the form of greenhouses. About a half of the projects are run on a commercial basis while the other half are Research and Development (R and D) or demonstrations. At least 18 species of fish and 18 species of plant are produced at the various projects but eels and potted plants are grown at more of the commercially orientated projects than any other produce. There has been a significant increase in the number of commercially run projects during the past 10-15 years and this trend is likely to continue in view of the considerable savings that can be made on fuel. The size and number of commercial projects in the UK compares favourably with those in other EEC countries. (author).

53280 (PB–89-214373/XAB) **Development of a combined quantity and quality model for optimal management of unsteady ground-water flow fields. Technical completion report.** Peralta, R.C.; Solaimanian, J.; Griffis, C.L. Arkansas Univ., Fayetteville, AR (USA). Water Resources Research Center. Jun 1988. 51p. (PUB–134). Available from NTIS, PC A04/MF A01.

See also PB–88-133772.

Alternative techniques are presented for incorporating conservative solute transport equations into computer models designed for optimizing ground-water extraction rates. The equations assume unsteady two-dimensional flow, and dispersed conservative solute transport. Implicit and explicit finite difference equations for solute transport are compared for practicality. After calibration, the equations are used in a MODCON procedure, an integrated series of five optimization or simulation modules. Results of the calculations are compared with those resulting from a model based upon the method of characteristics. The procedure is applicable for an entire aquifer system, or for a subject.

53281 (PB–89-215131/XAB) **Evaluation of nonpotable ground water in the desert area of southeastern California for powerplant cooling.** Steinemann, A.C. Geological Survey, Reston, VA (USA). Water Resources Div. 1989. 52p. (USGS/WATER-SUPPLY-PA–2343). Available from NTIS, PC A04/MF A01.

Also available from Supt. of Docs.\ Library of Congress catalog card no. 89-600019.

Powerplant siting is dependent upon many factors; in southern California the prevailing physical constraint is water availability. Increasing land use and other environmental concerns preclude further sites along the coast. A review of available hydrologic data was made of 142 ground-water basins in the southeast California desert area to ascertain if any could be feasible sources of nonpotable powerplant cooling water. Feasibility implies the capacity to sustain a typical 1,000-megawatt electrical-power generating plant for 30 years with an ample supply of ground water for cooling. Of the 142 basins reviewed, 5 met or exceeded established hydrologic criteria for supplying the water demands of a typical powerplant.

53282 (PB–89-863898/XAB) **Aquifers: Ground-water treatment. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 44p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning in-situ methods used in the restoration of contaminated aquifers. The utilization of microorganisms, denitrification studies, and the treatment of a number of aromatic hydrocarbons are among the topics discussed. Site-specific studies in a variety of hydrogeological environments are also included. (Contains 55 citations fully indexed and including a title list.)

53283 (PB–89-865752/XAB) **Water-resources data for states (United States). January 1985-July 1989 (Citations from the NTIS data base). Report for January 1985-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 158p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning water-resource data by state. Water-resources data consists of records of stage, discharge, and water quality of streams; the stage, contents, and water quality of lakes and reservoirs; and levels and quality of water wells. Completeness of information varies with each reporting state. Records are kept by the local Geological Survey. Water-quality standards are discussed in a separate bibliography. (Contains 339 citations fully indexed and including a title list.)

53284 (DOE/EA–0372) **Environmental assessment for proposed energy conservation standards for two types of consumer products; refrigerators, refrigerator-freezers, and freezers; small gas furnaces; and a proposed "No standard" standard for television sets.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). 1988. 27p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90001108. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This environmental assessment (EA) evaluates the environmental impacts resulting from new or amended energy-efficiency standard

for refrigerators, refrigerator-freezers, freezers, small gas furnaces, and television sets as mandated by the National Appliance Energy Conservation Act of 1987. A complete description of the Engineering and Economic Analysis of the proposed standards may be found elsewhere in the Technical Support Document (TSD). Four of the 14 scenarios for product design changes described in the Engineering Analysis of the TSD are chosen for environmental assessment based on their relative importance as design measures. Values for energy savings that result from product design changes are also taken from the TSD. The two main environmental concerns addressed are emissions from fossil fuel-fired electricity generation and the chlorofluorcarbons used in the production of rigid insulation foam. Each of the 12 design options for refrigerators and freezers result in decreased electricity use and and, therefore, reduced power plant emissions. Design changes that call for additional rigid foam insulation per appliance are of interest because they affect chlorofluorocarbon consumption. There is strong evidence that chlorofluorocarbons migrate to the stratosphere, break down, and catalyze the destruction of stratospheric ozone.

53285 (DOE/EA–0386) **Environmental assessment for proposed energy conservation standards for three types of consumer products: dishwashers, clothes washers and clothes dryers.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). [1989]. 24p. Sponsored by U.S. DOE Environment Health & Safety. Order Number DE90001109. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This environmental assessment (EA) evaluates the environmental impacts resulting from new or amended energy-efficiency standards for dishwashers, clothes washers and clothes dryers as mandated by the National Appliance Energy Conservation Act of 1987. A complete description of the Engineering and Economic Analysis of the proposed standards may be found elsewhere in the Technical Support Document (TSD). All eleven of the scenarios for product design changes described in the Engineering Analysis of the TSD are analyzed in the environmental assessment in the form of levels of pollutant reduction. Level 1 represents the least amount of pollutant reduction, while higher numbered levels represent increasingly more stringent standards, with correspondingly greater reductions in pollutants. Values for energy savings that result from product design changes are taken from the TSD. These energy savings are based on recent data on actual usage rather than DOE test procedures. 12 refs., 1 fig., 12 tabs.

53286 (IAEA-TECDOC–516, pp. 283-291) **Pseuchoneurotic disorders associated with the Chernobyl accident.** Aleksandrovskij, Yu.A. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

This survey relied largely on random selection. As a rule, the attention of the specialists was directed to people with certain specific complaints. Psychogenic disorders observed in the area of the accident at the Chernobyl plant were followed and studied by a team of specialists from the USSR Ministry of Health, beginning on 29 April 1986. According to the nature of the observed stress effects and of the resultant psychic disorders, it was possible to delineate three periods: first the acute period of the disaster from the time of the accident, lasting about 10 days until completion of the evacuation of the population from the danger zone (5 May); second the intermediate delayed period, the period of comparatively early consequences (from 6 May to October 1986); and third, the period of remote consequences. In the course of the year, 1,572 people were examined. The data available indicate that the psychogenic disorders observed after the Chernobyl accident can be regarded as the consequence of a single process, the dynamics of which are determined on the one hand by the characteristics of the emergency situation and on the other by the traits and the degree of preparedness of the people involved. The special nature of the stress situation in all three periods - the threat to health - gave rise to certain characteristic clinical observations, primarily a high degree of somatization and hypochondria. An understanding of the psychological disorders affecting those who lived through the Chernobyl accident, and of their effects on the work capability and pattern of life of people at various stages after the accident, has made it possible to develop and implement a complex and refined system of prophylactic and medical measures. 53287 (CONF-8904252–Summ.) **Nomenclature for physical mapping of complex genomes.** National Inst. of General Medical Sciences, Bethesda, MD (USA); USDOE Office of Energy Research, Washington, DC (USA). Office of Health and Environmental Research; California Univ., San Francisco, CA (USA). Howard Hughes Medical Inst. Aug 1989. 12p. Sponsored by U.S. DOE Energy Research. From Conference on nomenclature for physical mapping of complex genomes; Rockville, MD (USA); 13-14 Apr 1989. Order Number DE89015173. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Among these issues, that of establishing nomenclature conventions, was seen to be fundamental to the development of useful data management systems and essential for the orderly and efficient development of such systems. Therefore, the present workshop was convened, as the first in the recommended series, to identify the issues involved in establishing nomenclature standards and to develop a set of recommendations for such standards. This report summarizes the proceedings of the workshop and lays out specific proposals for naming DNA entities for physical mapping. The scientific community should discuss and develop these proposals so that naming conventions can be established. The proposals apply specifically to human DNA entities; however, the relevance to nomenclature in other systems should be part of the broader discussion. 13 refs.

53288 (JAERI-M–89-052) **Production of cellulase from immobilized Trichoderma reesei.** Kasai, Noboru; Tamada, Masao; Kumakura, Minoru. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 21p. (In Japanese). Order Number DE90709981. Available from NTIS (US Sales Only), PC A03/MF A01.

This report completed the results that obtained on the study of the enzyme activity in the culture of immobilized Trichoderma reesei cells in flask scale (100ml) and bench scale (30l). In the flask scale culture, the batch and repeated batch culture were carried out, and in the bench scale culture, the batch, repeated batch and continuous culture were done by using a culture equipment that is an unit process of the bench scale test plant for saccharification of cellulosic wastes. The enzyme activity of the immobilized cells was higher than that of the intact cells in the flask scale culture and it was confirmed that the enzyme activity was not decreased on the repeated batch culture of six times even. In the bench scale culture, it was found that a optimum culture condition of the immobilized cells was not different from that of the free cells and the immobilized cells gave the enzyme solution with a high enzyme activity in the culture condition of 450rpm stirring speed and air supply of 0.1v/v/m above. The technique of the repeated batch and continuous culture for long times in bench scale without contamination was established. The enzyme activity of the immobilized cells in continuous culture became to be 85 % to that in batch culture and it was found that the enzyme solution with high enzyme activity was continuously obtained in the continuous culture for long times. (author).

53289 (Juel-2251) **Immobilazation of aerobic microorganisms on glassy sintered material, illustrated by the example of the production of L leucine using Corynebacterium glutamicum.** Buechs, J. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Biotechnologie; Technische Univ. Hamburg-Harburg, Hamburg (Germany, F.R.). Dec 1988. 225p. (In German). Order Number DE90711181. Available from NTIS (US Sales Only), PC A10/MF A01.

The aim of this study was to develop the carrier fixation of aerobic microorganisms on open-pore sintered glass material. The fermentative production of L-leucine from α cetonic isocaproic acid with Corynebacterium glutamicum was chosen as an example of a microbial process with a high demand of oxygen. (orig.).

53290 (ORNL/FTR-2530) **[Genetic effects of atomic radiation]: Foreign trip report, March 20-28, 1987.** Selby, P.B. Oak Ridge National Lab., TN (USA). 12 Apr 1987. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017346. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the Thirty-sixth session of UNSCEAR where he took an active part in the deliberations of the Genetic Sub-subgroup. Good progress was made in discussing the two documents that are in preparation that deal with genetics. Approximately one-third of the traveler's time was spent observing sessions of the main UNSCEAR committee itself, and the remainder was spent in the Genetic Sub-subgroup. Important contacts were made with several prominent geneticists. It was apparent how important it is to ORNL, to DOE, to the United States Government, and to UNSCEAR itself to have at least one representative from the United States on the Genetic Sub-subgroup who has firsthand familiarity with the mouse data that are used to such an important extent in genetic risk estimation. Many of these data were collected in the Biology Division of ORNL.

53291 (ORNL/FTR-2535) **[Enzyme bioassay and the use of enzymes in genetic research]: Foreign trip report, March 11, 1987-March 30, 1987.** Jacobson, K.B. Oak Ridge National Lab., TN (USA). 14 Apr 1987. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017344. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler spent 16 days in the Department of Genetics of the University of Valencia, Valencia, Spain, to develop a new assay for an enzyme and to present a series of lectures on enzymology. He also discussed research problems with several of the staff of the Department of Genetics.

53292 (ORNL/FTR-2540) **[Protein engineering]: Foreign trip report, April 4-9, 1987.** Mural, R.J. Oak Ridge National Lab., TN (USA). 21 Apr 1987. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017345. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended an international meeting, "Protein Engineering '87'," held at the University of Oxford. Speakers of international standing addressed 425 conferees on topics ranging from the theoretical aspects of protein structure to the therapeutic uses of "engineered" proteins. The traveler presented work of the Protein Engineering Program of the Biology Division at a poster session at this Conference. There were a number of opportunities to interact with colleagues and exchange information concerning this new and rapidly growing field.

53293 (ORNL/FTR-3390) **[Research on Trichoderma cellulases]: Foreign trip report, September 14-20, 1989.** Woodward, J. Oak Ridge National Lab., TN (USA). 29 Sep 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001095. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended TRICEL 89, the first international symposium on Trichoderma cellulases. He presented a paper summarizing his work at ORNL. He also visited Aston University in Birmingham, England, and gave a lecture describing his work at Oak Ridge National Laboratory (ORNL). In Vienna, the latest knowledge concerning Trichoderma cellulases was obtained, and two contacts were established that will lead to unclassified and nonproprietary cooperative research efforts between ORNL and these European colleagues. In Birmingham, unclassified and nonproprietary discussions were held with Professor P.E. Barker and his staff in the Department of Chemical Engineering and Applied Chemistry. As a result of these discussions, areas of research cooperation between ORNL and Aston University were identified, and it is hoped that this cooperation will attract funding from the National Science Foundation (US) and the European Economic Community (EEC).

53294 Regulation of functional cytodifferentiation and histogenesis in mammary epithelial cells: Role of the extracellular matrix. Bissell, M.J. (Lawrence Berkeley Lab., CA (USA)); Ram, T.G. *Environmental Health Perspectives (USA),* 80: 61-70 (Mar 1989). DOE Contract AC03-76SF00098.

Primary mammary epithelial cells provide a versatile system for the study of hormone and extracellular matrix (ECM) influences on tissue-specific gene expression. The authors have characterized the formation of aveolarlike morphogenesis and mammary-specific functional differentiation that occur when these cells are cultured on a reconstituted basement membrane (EHS). Cells cultured on EHS exhibit many ultrastructural and biochemical features indicative of polarized and functionally differentiated mammary epithelium in vivo. The increased expression and specific vectorial secretion of milk proteins into lumina formed in culture are accompanied by large increases in milk protein mRNA expression. However, when individual ECM components are tested, smaller increases in milk protein mRNA are measured on heparan sulfate proteoglycan (HSPG) and laminin, and these responses are not associated with full functional cytodifferentiation or histotypic configuration. This indicates that multiple levels of regulation are involved in mammary-specific gene expression, and that in addition to individual ligand requirements cooperative interactions between various ECM molecules and cells are necessary for functional differentiation in culture. They have also shown that endogenous production of ECM molecules and changes in cell geometry are correlated with changes in functional and histogenic gene expression. They have previously proposed a model of cell-ECM interactions that is consistent with these data.

53295 Changes in nucleosome repeat lengths precede replication in the early replicating metallothionein II gene region of cells synchronized in early S phase. D'Anna, J.A. (Los Alamos National Lab., NM (USA)); Tobey, R.A. *Biochemistry (USA),* 28(7): 2895-2902 (4 Apr 1989).

Previous investigations showed that inhibition of DNA synthesis by hydroxyurea, aphidicolin, or 5-fluorodeoxyuridine produced large changes in the composition and nucleosome repeat lengths of bulk chromatin. There the authors report results of investigations to determine whether the changes in nucleosome repeat lengths might be localized in the initiated replicons, as postulated. In most experiments, Chinese hamster (line CHO) cells were synchronized in G1, or they were synchronized in early S phase by allowing G1 cells to enter S phase in medium containing 1 mM hydroxyurea or 5 μg mL^{-1} aphidicolin, a procedure believed to produce an accumulation of initiated replicons that arise from normally early replicating DNA. Measurements of nucleosome repeat lengths of bulk chromatin, the early replicating unexpressed metallothionein II (MTII) gene region, and a later replicating repeated sequence indicate that the changes in repeat lengths occur preferentially in the early replicating MTII gene region as G1 cells enter and become synchronized in early S phase. During that time, the MTII gene region is not replicated nor is there any evidence for induction of MTII messenger RNA. Thus, the results are consistent with the hypothesis that changes in chromatin structure occur preferentially in the early replicating (presumably initiated) replicons at initiation or that changes in chromatin structure can precede replication during inhibition of DNA synthesis. The shortened repeat lengths that precede MTII replication are, potentially, reversible, because they become elongated when the synchronized early S-phase cells are released to resume cell cycle progression.

53296 Characterization of the cytochrome c oxidase in isolated and purified plasma membranes from the cyanobacterium Anacystis nidulans. Peschek, G.A. (Univ. of Vienna (Austria)); Wastyn, M.; Trnka, M.; Molitor, V.; Fry, I.V.; Packer, L. *Biochemistry (USA),* 28(7): 3057-3063 (4 Apr 1989). DOE Contract FG03-87ER13736.

Functionally intact plasma membranes were isolated from the cyanobacterium (blue-green alga) Anacystis nidulans through French pressure cell extrusion of lysozyme/EDTA-treated cells, separated from thylakoid membranes by discontinuous sucrose density gradient centrifugation, and purified by repeated recentrifugation. Origin and identity of the chlorophyll-free plasma membrane fraction were confirmed by labeling of intact cells with impermeant protein markers, [^{35}S]diazobenzenesulfonate and fluorescamine, prior to membrane isolation. Rates of oxidation of reduced horse heart cytochrome c by purified plasma and thylakoid membranes were 90 and 2 nmol min^{-1} (mg of protein)$^{-1}$, respectively. The cytochrome oxidase in isolated plasma membranes was identified as a copper-containing aa_3-type enzyme from the properties of its redox-active and EDTA-resistant Cu^{2+} ESR signal, the characteristic inhibition profile, reduced minus oxidized difference spectra, carbon monoxide difference spectra, photoaction and photodissociation spectra of the CO-inhibited enzyme, and immunological cross-reaction of two subunits of the enzyme with antibodies against subunits I and II, and the holoenzyme, of Paracoccus denitrificans aa_3-type cytochrome oxidase. The data presented are the first comprehensive evidence for the occurrence of aa_3-type cytochrome oxidase in the plasma membrane of a cyanobacterium similar to the corresponding mitochondrial enzyme.

53297 **Sequence specificity of DNA cleavage by Bis(1,10-phenanthroline)copper(I): Effects of single base pair transitions on the cleavage of preferred pyrimidine-purine-pyrimidine triplets.** Veal, J.M. (Florida State Univ., Tallahassee (USA)); Rill, R.L. *Biochemistry (USA),* 28(8): 3243-3250 (18 Apr 1989).

The cleavage of DNA restriction fragments by bis(1,10-phenanthroline)copper(I) [$[(OP)_2Cu^I]^+$] is sequence dependent: the trimer TAT is most strongly preferred, while the trimer TGT and tetramers TAAT, TAGT, and CAGT are strongly to moderately preferred. $[(OP)_2Cu^I]^+$ cleavage of a series of oligonucleotide duplexes of the type 5'-CCCTPyPuPyCCCC-3'/3'-GGGAPuPyPuGGGG-5' (Py = pyrimidine; Pu = purine) was examined to determine the effects of purine substituents in the central triplet on specificity. The relative cleavage rates of different PyPuPy triplets in oligomers were similar to those observed for restriction fragments. The undecamer duplex containing the trimer TAT (TTATC) was most preferentially cleaved, predominantly at the central adenosine and the adjacent 3'-thymidine. Duplexes differing from TTATC by a single A·T → G·C transition in the central triplet were cleaved at significantly reduced rates relative to TTATC, the order of preference being TAT > TGT > TAC > CAT. The guanine 2-amino group at positions 1 and 2, but not position 3, of a 5'-PyPuPy-3' trimer is implicated as a strong inhibitor of DNA binding by the copper-phenanthroline complex. The influence of the guanine 2-amino group and other features of the cleavage at PyPuPy triplets can be rationalized by a partial intercalation binding model in which one phenanthroline ring system intercalates into the DNA minor groove at the 5'-PyPu-3' step.

53298 **Human genes for complement components C1r and C1s in a close tail-to-tail arrangement.** Kusumoto, H. (Univ. of Michigan Medical School, Ann Arbor (USA)); Hirosawa, S.; Salier, J.P.; Hagen, F.S.; Kurachi, K. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(19): 7307-7311 (Oct 1988). DOE Contract FG02-87ER60533.

Complementary DNA clones for human C1s were isolated from cDNA libraries that were prepared with poly(A)$^+$ RNAs of human liver and HepG2 cells. A clone with the largest cDNA insert of 2,664 base pairs (bp) was analyzed for its complete nucleotide sequence. It contained 202 bp of a 5' untranslated region, 45 bp of coding for a signal peptide (15 amino acid residues), 2,019 bp for complement component C1s zymogen (673 amino acid residues), 378 bp for a 3' untranslated region, a stop codon, and 17 bp of a poly(A) tail. The amino acid sequence of C1s was 40.5% identical to that of C1r, with excellent matches of tentative disulfide bond locations conserving the overall domain structure of C1r. DNA blotting and sequencing analyses of genomic DNA and of an isolated genomic DNA clone clearly showed that the human genes for C1r and C1s are closely located in a tail-to-tail arrangement at a distance of about 9.5 kilobases. Furthermore, RNA blot analyses showed that both C1r and C1s genes are primarily expressed in liver, whereas most other tissues expressed both C1r and C1s genes at much lower levels (less than 10% of that in liver). Multiple molecular sizes of specific mRNAs were observed in the RNA blot analyses for both C1r and C1s, indicating that alternative RNA processing(s), likely an alternative polyadenylylation, might take place for both genes.

53299 **Rous sarcoma virus transforming protein tyrosine kinase is expressed and active in sarcoma-free avian embryos microinjected with Rous sarcoma virus.** Howlett, A.R. (Lawrence Berkeley Lab., CA (USA)); Carter, V.C.; Martin, G.S.; Bissell, M.J. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(20): 7587-7591 (Oct 1988). DOE Contract AC03-76SF00098.

Early embryonic avian tissue is resistant to transformation by Rous sarcoma virus. To determine the nature of this resistance, the authors examined the expression and properties of the Rous sarcoma virus transforming protein $pp60^{v-src}$, in infected embryonic chicken limbs in ovo. Lysates from Rous sarcoma virus-infected limbs contained the viral structural protein $p19^{gag}$, as detected by immunoblot analysis and showed $pp60^{v-src}$ kinase activity in vitro. Immunoblot analysis of lysates with anti-phosphotyrosine antibodies revealed a number of phosphotyrosine-containing proteins present in lysates of Rous sarcoma virus-infected embryos but not in lysates of control, uninfected embryos. These studies demonstrate that $pp60^{v-src}$ is co-expressed with viral structural determinants in infected embryonic avian tissue. The localization pattern of the major src gene substrate p36 (calpactin I) was compared with that of $p19^{gag}$ by double-label immunofluorescence and found to be generally nonoverlapping. These observations are consistent with the concept that the induction of tumors in ovo requires complementation between viral determinants and host factors. These host factors, which may be critical substrates of $pp60^{src}$, are subject to developmental regulation in the avian embryo.

5503 Cytology

53300 (UCRL–101728) **The glycophorin A assay for somatic cell mutations in humans.** Langlois, R.G.; Bigbee, W.L.; Jensen, R.H. Lawrence Livermore National Lab., CA (USA). 18 Aug 1989. 12p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research; U.S. Department of Health and Human Services. DOE Contract W-7405-ENG-48. DNA-IARCO-89-869;NIH-ES-83-14. (CONF-8907113–12: 5. international conference on environmental mutagens, Cleveland, OH (USA), 10-15 Jul 1989). Order Number DE90001652. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

In this report we briefly review our past experience and some new developments with the GPA assay. Particular emphasis will be placed on two areas that affect the utility of the GPA assay for human population monitoring. The first is our efforts to simplify the GPA assay to make it more generally available for large population studies. The second is to begin to understand some of the characteristics of human hemopoiesis which affect the accumulation and expression of mutant phenotype cells. 11 refs., 4 figs.

53301 (DOE/ER/60408–1) **Correlation of chromosome patterns in leukemic cells of patients with exposure to chemicals and/or radiation: Progress report, January 1, 1989–September 30, 1989.** Rowley, J.D. Chicago Univ., IL (USA). Oct 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER60408. Order Number DE90001227. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We have identified two new recurring translocations involving chromosome 5; one is a 3;5 translocation and the other involves a rearrangement between chromosomes 5 and 7. The first is t(3;5)(q25.1;q35). We studied five patients with AML and a t(3;5) in their leukemic cells. At diagnosis, four of the patients had a t(3;5) as their sole karyotypic anomaly; the remaining patient had additional structural and numerical abnormalities. Careful cytogenetic analysis indicated that the breakpoints of this rearrangement were 3q25.1 and 5q34, in contrast to the various breakpoints reported in earlier studies (3q21 to 3q25 and 5q31 to 5q35). The karyotypic,

morphologic, and clinical characteristics of this group, as well as those of 15 previously reported patients with the t(3;5), were compared to identify any features that might warrant consideration of this anomaly as a specific syndrome. The median age of the group, 37 years, as younger than that of all patients with AML, 49 years. A preceding myelodysplastic syndrome was observed in three patients. We have no information regarding the occupation of most of these patients. Except for acute promyelocytic leukemia, each morphologic subtype occurred in these patients; however, the frequency of erythroleukemia (M6) was much greater than expected. 11 refs., 2 figs., 5 tabs.

53302 (UCRL–101590) **The somatic mutational component of human carcinogenesis.** Mendelsohn, M.L. Lawrence Livermore National Lab., CA (USA). Jul 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-8906223–1: Conference on statistical issues in quantitative cancer risk assessment, Snowbird, UT (USA), 18-22 Jun 1989). Order Number DE90001090. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Somatic mutation is the prototypic mechanism for the immediate, irreversible, additive effects that are characteristic of initiation of carcinogenesis. Such genetic changes are often used, explicitly or implicitly, as the transition device between stages in quantitative multistage models designed to describe carcinogenesis. Recent developments in the genetics of cancer and in somatic mutagenesis greatly increase our understanding of these processes, and are worth reviewing in the context of such multistage modelling. 23 refs.

5505 Metabolism

53303 (DOE/ER/13765–1) **Separating the influx and efflux components of net uptake of NO_3^- and NH_4^+ with the use of isotopic fractional data: Final report, July 15, 1987–July 14, 1989.** Shearer, G.; Kohl, D.H. Washington Univ., St. Louis, MO (USA). Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13765. Order Number DE90001200. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Transport processes are central to the life of organisms. It is important to dissect net uptake of metabolites and evaluate its components (influx and efflux). Results of our study have shown that our method, based on isotopic fractionation, is successful in separating the impact of changes in influx vs efflux on changes in net uptake of nitrate and that there is a high probability that the method will be equally successful with ammonium uptake. The methodology is applicable to steady state conditions unlike previous methods which involve the use of ^{15}N or ^{13}N labeled material or ^{14}C labeled analogs. These previous methods require short term measurements, the shorter, the more accurate. The isotopic fractionation methodology will be applicable to steady state experiments with other nutrients containing atoms whose stable isotope abundance is measurable at the level of precision necessary for determination of overall isotopic fractionation factors (e.g., C′, N, O, S). 33 refs., 3 figs., 2 tabs.

53304 A combination of radioanalytical and biochemical methods in the investigation of the selenium metabolism. Behne, D. *Transactions of the American Nuclear Society (USA),* 56: 145 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

As selenium is an essential element, the investigation of its metabolism is of great interest. Analytical methods have been used to determine the selenium levels in tissues of various animal species. Uptake, retention, and excretion of the element have been studied by means of tracer experiments. Considerably more detailed information on the metabolic fate of selenium can be obtained, however, if these methods are applied simultaneously and combined with biochemical procedures for the investigation of biologically important selenium compounds. In this way, the selenium metabolism in the tissues of the rat was studied. The quantitative determination of the element was carried out by instrumental neutron activation analysis via the gamma rays of either the long-lived radioisotope ^{75}Se (0.1-ng detection limit after a 10-day irradiation at a thermal neutron flux density of 5×10^{13} $cm^{-2} \cdot s^{-1}$) or the short lived ^{77m}Se (30-ng detection limit at a flux density of 1×10^{13} $cm^{-2} \cdot s^{-1}$). For the tracer experiments, ^{75}Se was used. In addition to these methods, procedures for the determination of the selenoenzyme glutathione peroxidase and for the investigation of other selenoproteins were applied.

53305 Advance prediction results for selenium measurement by INAA in biological reference materials. Guinn, V.P. (Univ. of California, Irvine (USA)). *Transactions of the American Nuclear Society (USA),* 56: 145-146 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The instrumental neutron activation analysis (INAA) Advance Prediction Computer Program (APCP) has been used to test (a) the detectability of selenium in 11 biological reference materials and (b) the relative advantages of using the 17.4-s ^{77m}Se activity or the 119.8-day ^{75}Se activity for the determination of selenium. The results of the APCP calculations, shown and discussed in this paper, are quite informative.

53306 Molecular neutron activation analysis of selenium metabolites in urine. Blotcky, A.J.; Hansen, G.T.; Ebrahim, A.; Rack, E.P. *Transactions of the American Nuclear Society (USA),* 56: 146-148 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Because of the biological importance of selenium in living biological systems, various analytical procedures have been developed for analysis of microquantities of elemental selenium, in urine, serum, and tissue. For urine selenium, these include atomic absorption spectrometry, solution absorption spectrometry, solution fluorescence spectrometry, volumetry, and neutron activation analysis. Of equal or greater importance is the determination of selenium metabolites present in urine for the purpose of describing the biological pathways for the metabolism of selenium in living organisms. While it is known from previous studies that trimethylselenonium ion (TMSe) is a major metabolite in urine, probably the result of reduction and methylation reaction, there are no definitive results in the literature indicating the nature or quantity of other selenium metabolic products in urine. Early techniques to measure TMSe levels in urine involved the use of the radiotracer ^{75}Se. Because of the long biological half-life of selenium and issues of radiation exposure, its use in humans has been limited. In this paper, the authors report the experimental procedure for the determination of total selenoamino acid concentration in urine and present total selenium values, and, where applicable, TMSe, $SeO^{2-}{}_3$, and total selenoamino acid concentrations in the urine of normal and diseased subjects.

53307 Evaluation of precision and accuracy of selenium measurements in biological materials using neutron activation analysis. Greenberg, R.R. *Transactions of the American Nuclear Society (USA),* 56: 148-149 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

In recent years, the accurate determination of selenium in biological materials has become increasingly important in view of the essential nature of this element for human nutrition and its possible role as a protective agent against cancer. Unfortunately, the accurate determination of selenium in biological materials is often difficult for most analytical techniques for a variety of reasons, including interferences, complicated selenium chemistry due to the presence of this element in multiple oxidation states and in a variety of different organic species, stability and resistance to destruction of some of these organo-selenium species during acid dissolution, volatility of some selenium compounds, and potential for contamination. Neutron activation analysis (NAA) can be one of the best analytical techniques for selenium determinations in biological materials for a number of reasons. Currently, precision at the 1% level (1s) and overall accuracy at the 1 to 2% level (95% confidence interval) can be attained at the U.S. National Bureau of Standards (NBS) for selenium determinations in biological materials when counting statistics are not limiting (using the ^{75}Se isotope). An example of this level of precision and accuracy is summarized. Achieving this level of accuracy, however, requires strict attention to all sources of systematic error. Precise and accurate results can also be obtained after radiochemical separations.

53308 **Nuclear-based methods for the study of selenium.** Spyrou, N.M. (Univ. of Surrey (England)); Akanle, O.A.; Dhani, A. *Transactions of the American Nuclear Society (USA),* 56: 149-150 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The essentiality of selenium to the human being and in particular its deficiency state, associated with prolonged inadequate dietary intake, have received considerable attention. In addition, the possible relationship between selenium and cancer and the claim that selenium may possess cancer-prevention properties have focused research effort. It has been observed in a number of studies on laboratory animals that selenium supplementation protects the animals against carcinogen-induced neoplastic growth in various organ sites, reduces the incidence of spontaneous mammary tumors, and suppresses the growth of transplanted tumor cells. In these research programs on the relationship between trace element levels and senile dementia and depression and the elemental changes in blood associated with selenium supplementation in a normal group of volunteers, it became obvious that in addition to establishing normal levels of elements in the population of interest, there was a more fundamental requirement for methods to be developed that would allow the study of the distribution of selenium in the body and its binding sites. The authors propose emission tomography and perturbed angular correlation as techniques worth exploring.

53309 **Neutron activation of selenium and arsenic with or without chemical separation.** Woittiez, J.R.W. *Transactions of the American Nuclear Society (USA),* 56: 150-151 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

At the Netherland Energy Research Foundation, neutron activation analysis (NAA) is one of the available techniques for elemental analysis. As the technique is potentially very powerful, considerable effort has been invested during the last 2 yr to optimize the multielement performance and to focus simultaneously on the best achievable single-element determination. This last activity implies concentrating the attention on measuring a well-defined signal rather than on software to evaluate complicated signals. As several irradiation facilities can be used, it is possible to choose the best obtainable instrumental activation technique. For the analysis of trace elements on the nanogram per gram level in biological material, however, the reintroduction of chemical separation of irradiated samples is inevitable. This paper presents recent results on applications of this approach. Although several well-documented techniques have been adapted, installed, and applied, and results are obtained for cadmium, molybdenum, chromium, cobalt, tin, iron, and mercury, this discussion is limited to selenium and arsenic.

53310 **Radiochemical methods for selenium in biological materials.** Keydom, K. *Transactions of the American Nuclear Society (USA),* 56: 152 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The concentrations of selenium in many biological materials are high enough to permit determination by instrumental neutron activation analysis (INAA), so that a radiochemical separation is unnecessary. In some cases, however, a lower limit of detection or better precision may be important; in others, the highest possible accuracy is required. Here the lower standard deviations and elimination of interference that can be achieved by radiochemical methods justify the additional effort needed. Radiochemical separation of selenium may be based on: volatilization, precipitation, solvent extraction, adsorption, ion exchange, and other processes or combinations of these methods. In a comprehensive neutron activation analysis with chemical yield determination, the radiochemical separation must be preceded by a total sample decomposition in order that complete carrier equilibration can be ascertained. At the trace level of selenium concentration where both instrumental and radiochemical methods of analysis may give adequate precision, systematic differences between results are found for some matrices.

53311 **Instrumental and preconcentration NAA methods for selenium in biological materials.** Chatt, A. (Dalhousie Univ. (Canada)). *Transactions of the American Nuclear Society (USA),* 56: 152-153 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

At present, selenium is known to be a normal component of several enzymes, proteins, and some aminoacryl transfer nucleic acids. Certain selenium compounds have been reported to possess anticarcinogenic properties, slow the aging process, strengthen the immune system, enhance the sexual functions, etc. In order to understand the role of selenium in human and animal metabolism, analytical methods of high precision and accuracy and of excellent sensitivity are being sought. Neutron activation analysis (NAA) has many advantages that can be exploited for determining selenium. In general, instrumental NAA (INAA) is sensitive enough for the determination of selenium in most biological materials. The determination of very low levels of selenium, e.g., less than 30 ppb, in the presence of large amounts of interfering elements such as sodium, bromine, chlorine, etc., can be facilitated by preconcentration NAA. The technique can also provide superior precision.

53312 **Selenium determinations for the assessment of sample stability in specimen banking.** Zeisler, R.; Greenberg, R.R.; Stone, S.F.; Sullivan, T.M. *Transactions of the American Nuclear Society (USA),* 56: 153-154 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

A comprehensive approach to the analysis of human livers has been developed in a pilot program for a National Environmental Specimen Bank (NESB). Since 1980, the pilot NESB program has examined the collection, processing, storage, and analysis of human livers. Neutron activation analysis (NAA) played a major role in the implemented analytical scheme. Up to 28 elements have been determined by NAA in 96 human livers, which were selected from 3 yr of collection-1980, 1982, and 1984-to establish baseline concentration values at the time the samples were collected and banked. Recently, samples banked in 1980 were withdrawn to be reanalyzed for the assessment of their long-term stability under different storage conditions. Choosing selenium as an example, this paper discusses the NAA procedures needed to arrive at highly precise and accurate data as the basis for the stability evaluation.

53313 **The use of neutron activation analysis to determine selenium status in the Australian diet.** Fardy, J.J.; McOrist, G.; Farrar, Y.J.; Gorman, T.F.; Bowles, C.J. *Transactions of the American Nuclear Society (USA),* 56: 154-155 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Selenium is one of a number of trace elements essential to the human system. Its chief biochemical role is to protect tissue against oxidative damage via the activity of glutathione peroxidase. The toxicity of selenium was well know long before its recognition as an essential trace element. Recent measurements in our laboratory have indicated that the average selenium content in the plasma of Australians is 0.09 $mg \cdot l^{-1}$, which is significantly lower than that found in the inhabitants of most other Western countries. Research aimed at explaining these low levels has begun and involves measurement of selenium concentration in foodstuffs most commonly consumed by the Australian population. An excellent review by Dreosti on selenium stressed the need for this information. In addition, these measurements will include other toxic elements-arsenic, mercury, zinc, and antimony-and the other trace elements determined by instrumental neutron activation analysis (INAA) techniques. To complete the survey of toxic elements, the lead and cadmium in the chosen foodstuffs are being analyzed by anodic stripping voltammetry and inductively coupled plasma mass spectrometry. This paper reports only the NAA results for selenium.

53314 **Determination of sampling constants for selenium by cyclic INAA.** Chatt, A. (Dalhousie Univ. (Canada)); Jayawickreme, C.K. *Transactions of the American Nuclear Society (USA),* 56: 155-156 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Biological reference materials of natural origin and certified elemental composition play an important role in not only evaluating the reliability of a new method but also assuring the quality of data produced in routine analysis. In fact, it has become a common practice to include an appropriate certified reference material (CRM) in every batch of samples analyzed for the purpose of quality assurance. One of the most important properties of a CRM or reference material (RM) should be its degree of homogeneity. For biological

materials, inhomogeneity is inherently associated with their intricate structures. In order to justify the usage of a CRM or RM at a mass lower than that recommended by the issuing agency, is necessary to evaluate the homogeneity at lower mass ranges and to determine the sampling constant for the element of interest. The objectives of the present work are to investigate the homogeneity and to calculate the sampling constants for selenium in several biological CRM and RM that are frequently used to evaluate the accuracy of measurements.

53315 (AD-A–209225/2/XAB) **Intraoperative radiation therapy: Characterization and application. Master's thesis.** Ruck, W.R. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Mar 1989. 75p. (AFIT/GNE/ENP–89M-7). Available from NTIS, PC A04/MF A01.

The goal of this project was to define and perform the dosimetry measurements required to characterize a set of 18 applicators for use in Intraoperative Radiation Therapy (IORT). IORT is one of the newest tools in the fight against cancer. In IORT, malignant tumors are exposed directly to high-energy electrons delivered through a specially designed applicator mounted on a linear accelerator. The medical physicist must provide an adequate description of the dose delivery characteristics for every combination of IORT applicator and electron-beam energy. Briefly, the characteristics of interest include: isodose charts, output factors, effective Source-to-Source-Distances (SSDs), offset factors, and Central-Axis (CAX) profiles. Each characteristic is important in the IORT treatment planning process. Isodose charts are used to help select the right combination of IORT applicator and electron-beam energy. Output factors and the offset factors are used to scale the prescribed dose to the appropriate number of monitor units (MUs). CAX profiles are used to find surface dose factors, output factors, and x-ray dose factors. Radiographic film is used to obtain the isodose charts and CAX profiles. Effective SSDs are measured using a parallel-plate ionization chamber. In general the results are comparable to those found by personnel at the Mayo Clinic for their IORT system. The only difference is the observation that effective SSDs are dependent upon the diameter of the IORT applicator and the electron-beam energy.

53316 (BNL–43271) **Epithermal beam development at the BMRR [Brookhaven Medical Research Reactor]: Dosimetric evaluation.** Saraf, S.K.; Fairchild, R.G.; Kalef-Ezra, J.; Laster, B.H.; Fiarman, S.; Ramsey, E. Brookhaven National Lab., Upton, NY (USA). 24 Aug 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8903150–4: Workshop on neutron beam design, development and performance for neutron capture therapy, Cambridge, MA (USA), 30-31 Mar 1989). Order Number DE90001272. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The utilization of an epithermal neutron beam for neutron capture therapy (NCT) is desirable because of the increased tissue penetration relative to a thermal neutron beam. Over the past few years, modifications have been and continue to be made at the Brookhaven Medical Research Reactor (BMRR) by changing its filter components to produce an optimal epithermal beam. An optimal epithermal beam should contain a low fast neutron contamination and no thermal neutrons in the incident beam. Recently a new moderator for the epithermal beam has been installed at the epithermal port of the BMRR and has accomplished this task. This new moderator is a combination of alumina (Al_2O_3) bricks and aluminum (Al) plates. A 0.51 mm thick cadmium (Cd) sheet has reduced the thermal neutron intensity drastically. Furthermore, an 11.5 cm thick bismuth (Bi) plate installed at the port surface has reduced the gamma dose component to negligible levels. Foil activation techniques have been employed by using bare gold and cadmium-covered gold foil to determine thermal as well as epithermal neutron fluence. Fast neutron fluence has been determined by indium foil counting. Fast neutron and gamma dose in soft tissue, free in air, is being determined by the paired ionization chamber technique, using tissue equivalent (TE) and graphite chambers. Thermoluminescent dosimeters (TLD-700) have also been used to determine the gamma dose independently. This paper describes the methods involved in the measurements of the above mentioned parameters. Formulations have been developed and the various corrections involved have been detailed. 12 refs.

53317 (BNL–43330) **Contrast agent choice for intravenous coronary angiography.** Zeman, H.D.; Siddons, D.P. Brookhaven National Lab., Upton, NY (USA). 1989. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016;FG03-87ER60527. (CONF-890802–6: 7. synchrotron radiation instrumentation (SRI) national conference, Berkeley, CA (USA), 6-10 Aug 1989). Order Number DE90001549. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The screening of the general population for coronary artery disease would be practical if a method existed for visualizing the extent of occlusion after an intravenous injection of contrast agent. Measurements performed with monochromatic synchrotron radiation x-rays and an iodine containing contrast agent at the Stanford Synchrotron Radiation Laboratory have shown that such an intravenous angiography procedure would be possible with an adequately intense monochromatic x-ray source. Because of the size and cost of synchrotron radiation facilities it would be desirable to make the most efficient use of the intensity available, while reducing as much as possible the radiation dose experienced by the patient. By choosing contrast agents containing elements with a higher atomic number than iodine, it is possible to both improve the image quality and reduce the patient radiation dose, while using the same synchrotron source. By using Si monochromator crystals with a small mosaic spread, it is possible to increase the x-ray flux available for imaging by over an order of magnitude, without any changes in the storage ring or wiggler magnet. The most critical imaging task for intravenous coronary angiography utilizing synchrotron radiation x-rays is visualizing a coronary artery through the left ventricle or aorta which also contains a contrast agent. Calculations have been made of the signal to noise ratio expected for this imaging task for various contrast agents with atomic numbers between that of iodine and bismuth.

53318 (DOE/ER/60407–3) **Improving cancer treatment with cyclotron produced radionuclides: Progress report: Retrospective summary, 1958–1988.** Laughlin, J.S.; Larson, S.M. Sloan-Kettering Inst. for Cancer Research, New York, NY (USA). 1988. 76p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER60407. Order Number DE90001207. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

This new DOE proposal appropriately builds on past developments. The development and application of radionuclides for diagnosis, treatment and research has been a continuing concern for more than the past three decades. A brief description of this development and previous achievements was considered important in order to provide a frame of reference for the evolving program here. Earlier, the use of certain radionuclides, radon progeny and I-131 in particular, and also x-rays, had been developed by the work of such pioneers as Failla, Quimby and Marinelli. In 1952, at the instigation of Dr. C.P. Rhoads, Director of both Memorial Hospital and Sloan-Kettering Institute, the restoration of the Department of Physics and Biophysics was undertaken in response to a perceived need to promote the utilization of radionuclides and of high energy radiations for therapeutic, diagnostic and research purposes. This resulted in several research and developmental projects with close clinical collaboration in areas of radiation treatment; medical studies with radionuclides and labeled compounds; the diagnostic uses of x-rays; and some projects in surgery and other clinical areas. Aspects of some of these projects that have had some relevance for the evolving AEC-DOE projects are outlined briefly. 34 refs.

L-41571.

It is shown that using needless method of radiopharmaceutical injection under high pressure into a tumour to irradiate it a an infiltration of tumour of large size with a preparation is guaranteed. Radiation loads of personnel are decreased when using the method. It is expedient to examine a needless method of radiopharmaceutical injection under pressure to irradiate a tumor in order to assess efficiency of irradiation using the above method of injection.

Short note. LUNGS/biomedical radiography; LUNGS/injuries; CHEST; DIAGNOSIS; LUNGS; INJURIES; PATIENTS; SYMPTOMS

53343 (INIS-SU–115/A, pp. 58-60) **State of small intestine after duodenae ulcerrhaphy.** Il'yashevich, E.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. 1 tab. SMALL INTESTINE/biomedical radiography; DIAGNOSIS; PATIENTS; SURGERY; ULCERS

53344 (INIS-SU–115/A, pp. 60-62) **Small intestine in defayed time after trunk vagotomy.** Il'yashevich, E.V.; Shaplyko, V.I. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. 1 tab. SMALL INTESTINE/biomedical radiography; BIOLOGICAL FUNCTIONS; DIAGNOSIS; PATIENTS; SURGERY; SYMPTOMS; ULCERS; VAGUS

53345 (INIS-SU–115/A, pp. 62-63) **Roentgenoradiological investigation of children with mechanical injuries of kidneys and urinary tract.** Kasaev, A.A.; Tsvetkova, I.G. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. KIDNEYS/biomedical radiography; KIDNEYS/injuries; URINARY TRACT/biomedical radiography; URINARY TRACT/injuries; CHILDREN; DIAGNOSIS; EFFICIENCY; KIDNEYS; INJURIES; NUCLEAR MEDICINE; PATIENTS

53346 (INIS-SU–115/A, pp. 65-67) **Cholepnevmoduodenography in complex roentgenoendoscopic investigation in patients with duodenal diverticulum.** Kulikov, V.A.; Ivanov, V.I. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. SMALL INTESTINE/biomedical radiography; SMALL INTESTINE/pathological changes; BLOOD VESSELS; DIAGNOSIS; IMAGES; PATIENTS

53347 (INIS-SU–115/A, pp. 67-68) **Efficiency of roentgenological investigations in diagnosis of myocardial infarction and left ventricular failure.** Kutateladze, N.M.; Kvaliashvili, Yu.A.; Khvichiya, N.Ya. and others. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. HEART FAILURE/biomedical radiography; MYOCARDIAL INFARCTION/biomedical radiography; BIOLOGICAL FUNCTIONS; DIAGNOSIS; EFFICIENCY; PATIENTS

53348 (INIS-SU–115/A, pp. 68-69) **Resolution of review roentgenography of chest organs in diagnosis of acute respiratory failure.** Lazyuk, I.I.; Sergeeva, A.A.; Borisevich, G.A. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. CHEST/biomedical radiography; RESPIRATORY SYSTEM DISEASES/diagnosis; CHEST; CHILDREN; EFFICIENCY; PATIENTS; RESOLUTION; DIAGNOSIS; SYMPTOMS

53349 (INIS-SU–115/A, pp. 70-71) **Chronic carditis (clinico-roentgeno-morphological comparison).** Lazyuk, I.I.; Lazyuk, D.G.; Puchkov, G.F. and others. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. CARDIOVASCULAR DISEASES/diagnosis; MYOCARDIUM/biomedical radiography; DIAGNOSIS; CHILDREN; MORPHOLOGICAL CHANGES; MYOCARDIUM; PATIENTS; SYMPTOMS

53350 (INIS-SU–115/A, pp. 73) **Experience on roentgenological diagnosis of duodenal permeability failure.** Lifshits, S.Z.; Chulkova, O.M. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. SMALL INTESTINE/biomedical radiography; BIOLOGICAL FUNCTIONS; DIAGNOSIS; DYNAMIC FUNCTION STUDIES; PATHOLOGICAL CHANGES; PATIENTS

53351 (INIS-SU–115/A, pp. 74-76) **Uniform dilatation of biliary ducts as index of Sphincter Mirizzi hypoplasia.** Markvarde, M.M.; Ehranos'yan, M.G. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. 1 tab. BILIARY TRACT/biomedical radiography; DIGESTIVE SYSTEM DISEASES/diagnosis; ANATOMY; BIOLOGICAL FUNCTIONS; DIAGNOSIS; PATHOLOGICAL CHANGES; PATIENTS; SYMPTOMS

53352 (INIS-SU–115/A, pp. 82-83) **On roentgenodiagnosis of irritable colon syndrome.** Mikhajlov, A.N.; Malevich, Eh.E. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. LARGE INTESTINE/biomedical radiography; PATHOLOGICAL CHANGES/diagnosis; BIOLOGICAL FUNCTIONS; DIAGNOSIS; PATIENTS; SYMPTOMS

53353 (INIS-SU–115/A, pp. 84-85) **Improved roentgenological technique for gastroesophageal reflux indentification.** Mogil'nitskaya, M.A.; Levin, M.D. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. ESOPHAGUS/biomedical radiography; ESOPHAGUS/pathological changes; STOMACH/biomedical radiography; STOMACH/pathological changes; DIAGNOSIS; EFFICIENCY; ESOPHAGUS; PATIENTS; STOMACH

53354 (INIS-SU–115/A, pp. 86-87) **Radiation burdens on patients and medical personnel durng investigations on X-ray computerized tomographe.** Moroz, N.S.; Ostapenko, N.I. Minskij

Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. COMPUTERIZED TOMOGRAPHY/dosimetry; COMPUTERIZED TOMOGRAPHY/radiation doses; RADIOLOGICAL PERSONNEL/radiation doses; DOSIMETRY; DIAGNOSIS; EFFICIENCY; PATIENTS; X RADIATION

53355 (INIS-SU--115/A, pp. 87-89) **Differential roentgenodiagnosis of stomach ulceration.** Nekrashevich, V.V.; Zhakova, L.A.; Filippovich, N.S.; Korostelev, Yu.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. STOMACH/biomedical radiography; DIAGNOSIS; NEOPLASMS; PATHOLOGICAL CHANGES; PATIENTS; STOMACH; SYMPTOMS

53356 (INIS-SU--115/A, pp. 89-91) **Complex roentgenoradiological and endoscopic examination in evaluation of kidney functions and some causes of their failure in patients with ureterosigma anastomosis.** Nechiporenko, N.A.; Galkin, L.P.; Bushanova, Z.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. KIDNEYS/biomedical radiography; KIDNEYS/nuclear medicine; UROGENITAL SYSTEM DISEASES/diagnosis; BIOLOGICAL FUNCTIONS; KIDNEYS; PATHOLOGICAL CHANGES; PATIENTS; URINARY TRACT; DIAGNOSIS

53357 (INIS-SU--115/A, pp. 91-92) **Forecasting significance of fluoroscopic data (according to materials of patients dead of heart ischemia and hypertension).** Nizovtsova, L.A. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. CARDIOVASCULAR DISEASES/fluoroscopy; CARDIOVASCULAR DISEASES/forecasting; FLUOROSCOPY; FORECASTING; EFFICIENCY; PATIENTS; SYMPTOMS

53358 (INIS-SU--115/A, pp. 93-94) **Roentgenological evaluation of the efficiency of physical exercises during rehabilitation therapy of patients with myocardial infarction.** Nizovtsova, L.A.; Al'khimovich, V.M.; Rusetskaya, V.G. and others. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. BIOMEDICAL RADIOGRAPHY/myocardial infarction; MYOCARDIAL INFARCTION/exercise; MYOCARDIAL INFARCTION/therapy; DIAGNOSIS; EFFICIENCY; EXERCISE; THERAPY; PATIENTS

53359 (INIS-SU--115/A, pp. 95-96) **Zonography in children with kidney developmental anomaly.** Petkevich, G.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. KIDNEYS/pathological changes; URINARY TRACT/biomedical radiography; CHILDREN; DIAGNOSIS; KIDNEYS; PATIENTS

53360 (INIS-SU--115/A, pp. 96-97) **Computerized tomography in diagnosis of chronic pancreatitis.** Petukhov, V.N.; Sel'khov, Yu.I.; Gulitskaya, L.I.; Silivonchik, N.N. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. DIGESTIVE SYSTEM DISEASES/diagnosis; PANCREAS/computerized tomography; DIAGNOSIS; PANCREAS; PATIENTS; SYMPTOMS

53361 (INIS-SU--115/A, pp. 98-100) **Roentgenological approach to differential diagnosis of cardialgias.** Rozhkovskaya, V.V.; Romanenko, T.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. CHEST/biomedical radiography; CHEST; DIAGNOSIS; HEART; PATIENTS; SKELETON; STOMACH; SYMPTOMS

53362 (INIS-SU--115/A, pp. 28-30) **Use of radionuclide evaluation method of drugs (obsidan, pirroxan) effect on haemodynamics in lesser circulation in patients with hypertension.** Volkov, N.F.; Ersh, I.R.; Zajtsev, V.I.; Tekhneryadov, V.I. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. HYPERTENSION/blood circulation; HYPERTENSION/nuclear medicine; BIOLOGICAL FUNCTIONS; DIAGNOSIS; DRUGS; HYPERTENSION; PATIENTS

53363 (INIS-SU--115/A, pp. 30) **Effect of sustac on haemodynamics in patients with ishemia by radiocirculographic data.** Volkov, N.F.; Snezhitskij, V.A.; Borejsho, D.E.; Mironchik, E.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. BLOOD CIRCULATION/diagnosis; BIOLOGICAL FUNCTIONS; DIAGNOSIS; DRUGS; EFFICIENCY; ISCHEMIA; NUCLEAR MEDICINE; PATIENTS; THERAPY

53364 (INIS-SU--115/A, pp. 32-33) **Radionuclide method of evaluation of effective kidney blood circulation changes under the effect of anapryline intake in patients with chronic ishemia.** Galkin, L.P.; Snezhitskij, V.A.; Kurejsha, Eh.K. and others. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. BLOOD CIRCULATION/dynamic function studies; DIAGNOSIS; DRUGS; ISCHEMIA; KIDNEYS; NUCLEAR MEDICINE; PATIENTS; THERAPY

53365 (INIS-SU--115/A, pp. 47-49) **Causes of failure during intravenous choleography and possibilities of their removal.** Druzhinina, V.S.; Melekhova, L.S. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380--: 4. conference of roentgenologists and radiologists of Byelorussian SSR,

Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. NUCLEAR MEDICINE/biliary tract; BLOOD CIRCULATION; DIAGNOSIS; EFFICIENCY; LIVER; PATIENTS; RECTAL ADMINISTRATION; XENON 133

53366 (INIS-SU–115/A, pp. 77-78) **Radionuclide method in diagnosis of mitral heart failure.** Mironchik, E.V.; Rakov, A.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. HEART FAILURE/diagnosis; BLOOD CIRCULATION; DIAGNOSIS; NUCLEAR MEDICINE; PATHOLOGICAL CHANGES; PATIENTS

53367 (INIS-SU–115/A, pp. 71-72) **Study on mobility of stomach antral part during preoperative radiotherapy.** Lesik, A.M.; Sukolinskij, V.N.; Sosnovskij, A.N.; Malakhov, A.V. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. NEOPLASMS/radiotherapy; DYNAMIC FUNCTION STUDIES; EFFICIENCY; NEOPLASMS; RADIOTHERAPY; PATIENTS; STOMACH; SURGERY

53368 (INIS-SU–115/A, pp. 103-104) **Roentgenocardiometry in patients with acute myocardial infarction.** Savchenko, A.P.; Tsellagova, Z.S.; Bakashvili, N.G. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. MYOCARDIAL INFARCTION/diagnosis; AGE DEPENDENCE; BIOMEDICAL RADIOGRAPHY; EFFICIENCY; DIAGNOSIS; PATIENTS

53369 (INIS-SU–115/A, pp. 106-108) **Roentgenological features of bile hypertension in patients with non-functioning gallbladder.** Sergeeva, I.I. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. BILIARY TRACT/biomedical radiography; BILE; BIOLOGICAL FUNCTIONS; DIAGNOSIS; HYPERTENSION; PATIENTS; SYMPTOMS

53370 (INIS-SU–115/A, pp. 108-109) **Roentgenosemiotics of cyst hypoplasia of lungs in children.** Sokur, P.P.; Bondarenko, A.P.; Pojda, Z.S. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. LUNGS/biomedical radiography; PATHOLOGICAL CHANGES/diagnosis; CHILDREN; LUNGS; DIAGNOSIS; PATIENTS; SYMPTOMS

53371 (INIS-SU–115/A, pp. 110-111) **Tactics of application of roentgenoendovascular dilatation during bilateral stenosing of kidney arteries.** Tarakanov, Yu.P. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. ARTERIES/biomedical radiography; ARTERIES; KIDNEYS; PATIENTS

53372 (INIS-SU–115/A, pp. 111-113) **Clinico-roentgenological characteristics of recurring form of nonspecific ulcerative colitis.** Timofeev, V.M. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. DIGESTIVE SYSTEM DISEASES/diagnosis; LARGE INTESTINE/biomedical radiography; DIAGNOSIS; PATIENTS; SYMPTOMS

53373 (INIS-SU–115/A, pp. 113-115) **Clinico-roentgenological characteristics of transitory form of nonspecific ulcerative colitis.** Timofeev, V.M. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. DIGESTIVE SYSTEM DISEASES/diagnosis; LARGE INTESTINE/biomedical radiography; DIAGNOSIS; PATIENTS; SEX DEPENDENCE; SYMPTOMS

53374 (INIS-SU–115/A, pp. 115-119) **Function of external respiration under normal conditions by roentgenopneumopolygraphic data.** Tikhomirova, T.F. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. 1 tab. LUNGS/biomedical radiography; RESPIRATION/dynamic function studies; AGE DEPENDENCE; LUNGS; PATIENTS; RESPIRATION; SEX DEPENDENCE

53375 (INIS-SU–115/A, pp. 119-123) **Peculiarities of regional reserve lung ventilation in patients with collagenoses by dynamic roentgenopneumopolygraphy data.** Tikhomirova, T.F. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. 2 tabs. LUNGS/biomedical radiography; RESPIRATION/dynamic function studies; EXERCISE; LUNGS; PATHOLOGICAL CHANGES; PATIENTS; RESPIRATION

53376 (INIS-SU–115/A, pp. 124-126) **Experience in roentgendiagnosis of cardiomyopathy.** Filippovich, N.S.; Nekrashevich, V.V.; Strel'chenya, S.N. Minskij Meditsinskij Inst., Minsk (Byelorussian SSR). 1988. (In Russian). (CONF-8809380–: 4. conference of roentgenologists and radiologists of Byelorussian SSR, Grodno (USSR), 8 Sep 1988). In *Actual problems of radiation diagnosis of thorax and abdomen organs' diseases. Vol. 1. Summaries of reports.* Order Number DE90705923. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Short note. CARDIOVASCULAR DISEASES/diagnosis; MYOCARDIUM/biomedical radiography; DIAGNOSIS; MYOCARDIUM; PATIENTS; SYMPTOMS

53399 (INIS-SU--131/A) **Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.** Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1988. 126p. (In Russian). Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

This document is a collection of papers concerning interferon.

53400 (INIS-SU--131/A, pp. 75-78) **Immunocorrection with levamysole in combined therapy of patients with rectum neoplasm according to theophyline tests.** Filatov, P.P.; Neprina, G.S.; Panteleeva, E.S.; Berdov, B.A. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

It is shown that application of immunotherapy by levamysole up to initiation of combined treatment of patients suffering from rectum cancer can be considered as justified. But a protective effect of this treatmet in relation to radiation injury of lymphocytes and acceleration of recovery of their quantity occur only in operable patients while in the group of primarily non-operable patients a positive (curative) levamysol effect is absent or weakly manifested. 3 refs.

53401 (INIS-SU--131/A, pp. 78-83) **Immunomodifying effect of VCG vaccine in treatment of urinary bladder neoplasm.** Neprina, G.S.; Panteleeva, E.S.; Vatin, O.E.; Karyakin, O.B.; Kurasova, V.G.; Filatov, P.P.; Dunchik, V.N. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

It is shown that immunotherapy realization using VCG vaccine after completion of PCT (polychemotherapy) course in patients suffering from later stages of urinary bladder neoplasm, allowed one to maximally connect stages of chemo- and radiation therapy at the expense of sufficient increase of the quantity of main groups of immunocompetent cells. Introduction of incometacin to immunocorrection scheme allowed one to remove disbalance in immunoregulating lymphocyte system which testifies to advisability of combined applicaion of VCG vaccine and indometacin in complex treatment of cerinary bladder neoplasms. 5 refs.

53402 (INIS-SU--131/A, pp. 83-87) **Test of leukocytes suppression in assessment of antitumoral immunity in oncourology.** Vatin, O.E.; Karyakin, O.B.; Sviridova, T.V.; Sirotkina, N.P.; Dunchik, V.N. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

Specific antitumoral immunity in patients suffering from urinary bladder neoplasm (UBN) and prostate neoplasms was studied before treatment and at different stages of immuno-, chemo- and radiation therapy. Data allowing one to believe that the tests of leukocyte adhesion suppression and serum blocking activity determination clearly reflect the development of non-specific leukocyte sensibilization in patients to corresponding tumor antigen which testifies to advisability of applying the tests indicated as additional ones in diagnosis and evaluation of antitumoral immunity, are presented. 6 refs.

53403 (INIS-SU--131/A, pp. 96-98) **Effect of hyperglycemia on the function of immunoregulatory cells and production of interleukine-2.** Savina, N.P. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

Functional properties of immunoregulatory cells in Con-A-induced suppressing activity test as well as interleukine-2-producing activity (IL-2) of lymphocytes are studied. It is shown that germinative factor increase at the final treatment stage levels the immunosuppressing effect of radiation therapy on immunoregulatory cells. So, regional artificial hyperglycemia applied in combination with traditional treatment methods produces a modulating effect on immunoregulatory cell function and lymphokine production. 4 refs.

53404 (INIS-SU--131/A, pp. 107-115) **Comparison of immunoregulators number and their functioning in case of lymphogranulomatosis. Modifying effect of component of complex treatment and other factors on immunoregulatory function.** Kuz'mina, E.G.; Yarilin, A.A.; Bajsogolov, G.D.; Shakhtarina, S.V. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

It is shown that cyclic functioning of non-specific regulators, lymphocyte proliferation is connected with periodic variations of suppressive cell quantity and helper/suppressor ratio. Ability of a number of substances (Con A, adenosine, theophylline, levanysole and diucyphon) to modify spontaneous regulators function and peculiarities of their effect on healthy people under active LG and continuous remission is revealed. 4 refs.; 1 tab.

53405 (INIS-SU--131/A, pp. 121-125) **Immunocorrection in radiation and combined treatment of neoplasms.** Karpova, N.A. Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR); Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Obninsk (USSR). 1989. (In Russian). In *Interferon inductors and other immunomodulators in radiology and oncology. Scientific reports collection.* Order Number DE90705924. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02943.

Data on the efficiency of a number of immunostimulating preparations under radiation and combined therapy of oncologic patients, testifying to the prospects of such investigations to increase the treatment efficiency, are presented. Possibilities of choosing such preparations, data on mechanisms and effect on separate components of immunity system under their suppression by oncologic, radiation and other factors are insufficient for a wide practical application. 15 refs.

53406 (LA-UR–89-1520) **Use of superconducting plates and shells to deflect magnetic noise fields: Application to MEG [magnetoencephalography].** Overton, W.C. Jr.; van Hulsteyn, D.B.; Flynn, E.R. Los Alamos National Lab., NM (USA). [1989]. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891148–1: 11. annual international conference of the IEEE Engineering in Medicine and Biology Society, Seattle, WA (USA), 9-12 Nov 1989). Order Number DE89012592. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Insertion of a superconducting plate or shell in a magnetic field causes a surface current distribution which opposes the applied field. Resultant fields near plate edges are higher while those near centers are much lower than applied fields. We make use of these principles in MEG by placing suitably oriented gradiometers at points where noise fields are smallest. Signals from nearby brain wave sources are enhanced because the net signal is a combination of that from the sources and that from its image. The principles of noise deflection and source imaging are applied to new concepts of gradiometry. 4 refs., 2 figs.

53407 (LUMEDW-MEOK–1007-1-79-1985) **ADPRT inhibitors and hyperthermia as radiosensitizers. Mechanistic studies using human leukocytes in vitro and a C3H mouse mammary carcinoma in vivo.** Jonsson, G.G. Lund Univ. Hospital (Sweden). Dept. of Oncology. 15 May 1985. 90p. Order Number DE90605244. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Hyperthermia given in combination with gamma radiation has given considerable improvement in the therapeutic results for treatment of malignant tumors. The mechanism behind the hyperthermia effect is probably operative at the tissue level as well as at the molecular level. The metabolism of NAD^+ in relation to the activity of the chromosomal enzyme ADP-ribosyl transferase (ADPRT) has been studied as a possible molecular mechanism for this effect. The ADPRT activity was measured after radiosensitization with both hyperthermia and nicotinamide, which is a potent inhibitor of ADPRT. The results indicate that hyperthermia can improve the effect of radiotherapy by reducing the supply of NAD^+, which is a co-substrate for ADPRT, while nicotinamide functions as a radiosensitizing agent by direct inhibition of the enzyme. The hypothesis is discussed in the thesis where inhibition of ADPRT might increase the radiosensitivity because the radiation-induced DNA damage can not be repaired with normal efficiency. The function of nicotinamide as a radiosensitizer was verified by studies on C3H mice with transplanted spontaneous mammary tumors. Because nicotinamide is not toxic, it seems quite attractive to test this vitamin as a radiosensitizing agent against human tumors. (251 refs.) (author).

53408 (PB–89-205215/XAB) **Routine compliance testing for diagnostic x-ray systems or components of diagnostic x-ray systems to which 21 CFR subchapter J is applicable.** Food and Drug Administration, Rockville, MD (USA). Center for Devices and Radiological Health. Dec 1988. 361p. (FDA/CDRH–89/90). Available from NTIS, PC A16/MF A01.

Supersedes PB–84-190958 and PB–85-146132.

This manual was developed by the National Center for Devices and Radiological Health, FDA, to establish procedures for routine testing of diagnostic x-ray systems for compliance with Federal Performance Standard 21 CFR 1021.30. It has been prepared to instruct FDA personnel and State officials who assist FDA in the use of the various devices that FDA may procure. The procedures and routine test equipment will be used for screening diagnostic x-ray systems for evidence of non-compliance with the Performance Standard. More rigorous followup testing will be performed as required. The manual has two major subject areas: testing procedures and test equipment. The first section presently contains procedures that provide efficient means of testing against many performance requirements and are applicable to many different types of x-ray systems. It includes detailed drawings of the routine compliance test stand, operating manuals for the x-ray exposure monitor and the photometer, and descriptions of how to use the direct-print paper.

53409 Myocardial ischaemia and clinical applications of positron emission tomography. Armbrecht, J.J. (California Univ., Los Angeles, CA (USA). Div. of Nuclear Medicine and Biophysics); Schelbert, H.R. *Nuklearmediziner (F.R. Germany),* 12(2): 93-107 (Apr 1989). (In German).

Positron emission tomography (PET) permits non-invasive investigation and quantification of regional blood flow and metabolic rates in the human myocard. In cases of myocardial ischaemia PET reveals the presence and extent of surviving tissue in dysfunctional myocardium and differenciates it from irreversible tissue damage and scar formation. Since metabolic markers have proven more precise and reliable than conventional diagnostic procedures in the identification of surviving myocard, the PET gains increasing importance in the evaluation of severity and extent of ischaemic cell damage. Based on these findings it is possible to stratify patients with acute or chronic myocardial ischaemia to the most effective treatment. (orig.).

53410 Conformational analysis of d(C_3G_3), a B-family duplex in solution. Wolk, S. (Univ. of California, Berkeley (USA)); Thurmes, W.N.; Ross, W.S.; Hardin, C.C.; Tinoco, I. Jr. *Biochemistry (USA),* 28(6): 2452-2459 (21 Mar 1989). DOE Contract FG03-86ER60406.

NMR and circular dichroism studies of the duplex formed by the self-complementary DNA hexanucleotide d(C_3G_3) indicate that it is a B-type structure but differs from standard B-form. An analysis of NMR coupling constants within the deoxyribose moieties yields a 70% or greater contribution from pseudorotation phase angles corresponding to the C3'-exo conformation, a conformation similar to the C2'-endo conformation associated with B-form DNA. Intranucleotide interproton distances are consistent with a B-form structure, but some internucleotide distances are intermediate between A- and B-form structures. Circular dichroism spectra have B-form characteristics but also include an unusual negative band at 282 nm. The solution spectroscopic results are in contrast with X-ray crystallographic studies which find A-form structures for similar sequences.

53411 Method for protecting bone marrow against chemotherapeutic drugs and radiation therapy using transforming growth factor beta 1. Keller, J.R.; Ruscetti, F.W.; Wiltrout, R. To Department of Health and Human Services, Washington, DC. USA Patent 7-372,815. 29 Jun 1989. 32p. Available from NTIS, PC A03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

Presented is a method for protecting hematopoietic stem cells from the myelotoxicity of chemotherapeutic drugs or radiation therapy, which comprises administering to a subject a therapeutically effective amount of transforming growth factor beta 1 for protecting bone marrow from the myelotoxicity of chemotherapeutic drugs or radiation therapy.

53412 (DOE/ER/60248–T1) **Decomposition in Arctic terrestrial environments: Project summary document.** Laursen, G.A. Alaska Univ., Fairbanks, AK (USA). School of Agriculture and Land Resource Management. 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-84ER60248. Order Number DE90001198. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The principal goal of this research unit is to further elucidate the rate and quality of microbial decomposition within cold, wet, Arctic tundra peat soils found in water tract systems of Foothills Province terrain (8-10°) on the north slope of Alaska. Research objectives include demonstration of of four hypotheses. A positive correlation exists between the rate of decomposing litter and the viable microbial (fungal) biomass, as measured by ARP activities and direct counts, associated with that litter. In Arctic tundra peat soil systems, there exists a positive correlation between the presence and abundance of viable mycelial biomass and the enzymatic potential for degradative activity as measured by the presence of cellulase, peroxidase, chitinase and protease enzymes produced by the miocrobial community. Substrate quality, as defined by lignin to cellulose ratios, influences the rate of natural litter decomposition. The lignin to total nitrogen ratio describes an inverse correlation to decomposition rates of litter.

53413 (ORNL/FTR–2848) **[Genetically engineered microorganisms]: Foreign trip report, April 1–9, 1988.** Sharples, F.E.

Oak Ridge National Lab., TN (USA). 18 Apr 1988. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017409. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the First International Conference on the Release of Genetically Engineered Microorganisms at the request of the United Nations Environment Programme (UNEP). The purpose of the conference was to provide an international forum for the discussion of the issues and concerns related to the release of genetically engineered microorganisms for environmental and agricultural applications. The cost of attendance was paid by UNEP, a group with whom a small Work-for-Others contract (to participate in developing international biosafety guidelines) is under discussion.

One of the unexpected fruits of basic physics research and the computer revolution is the noninvasive imaging power available to today's physician. Technologies that were strictly the province of research scientists only a decade or two ago now serve as the foundations for such standard diagnostic tools as x-ray computer tomography (CT), magnetic resonance imaging (MRI), magnetic resonance spectroscopy (MRS), ultrasound, single photon emission computed tomography (SPECT), and positron emission tomography (PET). Furthermore, prompted by the needs of both the practicing physician and the clinical researcher, efforts to improve these technologies continue. This booklet endeavors to describe the advantages of achieving high resolution in PET imaging. 6 refs., 21 figs.

53415 (LA-UR–89-3192) **Monitoring chaos of cardiac rhythms.** Mayer-Kress, G. Los Alamos National Lab., NM (USA). [1989]. 10p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-8910223–1: BIOTECH USA: 6th annual industry conference and exhibition, San Francisco, CA (USA), 2-4 Oct 1989). Order Number DE90000692. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Chaos theory provides a new paradigm in monitoring complexity changes in heart rate variability. Even in cases where the spectral analysis only shows broad band characteristics estimations of dimensional complexity parameters can show quantitative changes in the degree of chaos present in the interbeat interval dynamics. We introduce the concept of dimensional complexity as dynamical monitoring parameter and discuss its properties in connection with control data and data taken during cardiac arrest. Whereas dimensional complexity provides a quantitative indicator of overall chaotic behavior, recurrence plots allow direct visualization of recurrences in arbitrary high dimensional pattern-space. In combination these two methods from non-linear dynamics exemplify a new approach in the problem of heart rate monitoring and identification of precursors of cardiac arrest. Finally we mention a new method of chaotic control, by which selective and highly effective perturbations of nonlinear dynamical systems could be used for improved pacing patterns. 11 refs., 6 figs.

53416 **Cadmium accelerates bone loss in ovariectomized mice and fetal rat limb bones in culture.** Bhattacharyya, M.H. (Argonne National Lab., IL (USA)); Whelton, B.D.; Stern, P.H.; Peterson, D.P. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(22): 8761-8765 (Nov 1988). DOE Contract W-31-109-ENG-38.

Loss of bone mineral after ovariectomy was studied in mice exposed to dietary cadmium at 0.25, 5, or 50 ppm. Results show that dietary cadmium at 50 ppm increased bone mineral loss to a significantly greater extent in ovariectomized mice than in sham-operated controls. These results were obtained from two studies, one in which skeletal calcium content was determined 6 months after ovariectomy and a second in which ^{45}Ca release from ^{45}Ca-prelabeled bones was measured immediately after the start of dietary cadmium exposure. Furthermore, experiments with ^{45}Ca-prelabeled fetal rat limb bones in culture demonstrated that Cd at 10 nM in the medium, a concentration estimated to be in the plasma of mice exposed to 50 ppm dietary Cd, strikingly increased bone resorption. These in vitro results indicate that cadmium may enhance bone mineral loss by a direct action on bone. Results of the in vivo studies are consistent with a significant role of cadmium in the etiology of Itai-Itai disease among postmenopausal women in Japan and may in part explain the increased risk of postmenopausal osteoporosis among women who smoke.

53417 (PB–89-202709/XAB) **Health promotion/hazard protection at the workplace: A NIOSH (National Institute for Occupational Safety and Health) position and planning guide.** Cohen, A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Biomedical and Behavioral Science. 27 Oct 1983. 28p. Available from NTIS, PC A03/MF A01.

A position statement and framework for advancing health-promotion ideas and related functions concerned with worker well-being at the job site were developed. The study demonstrated the range of possibilities within current NIOSH surveillance, epidemiology, control research, information dissemination and training activities for developing such an integrated program. Specific tasks dealt with by the working group and reported on included: shaping a position for NIOSH on traditional health-promotion activities which would be compatible with the mandated concerns for protection from hazards at the workplace; inventorying NIOSH projects which included elements having significance to health promotion; and developing a framework to be used in organizing current and future work, mixing health promotion with workplace hazard protection objectives. The author suggests that the theme endorsing worker participation in hazard-recognition and monitoring programs should be further developed. Flagging real or suspected job safety hazards and rating their impact on worker-safety attitudes and injury rates should be explored. Additional emphasis is needed on the effect of various lifestyle features on occupational risk factors.

53420 (CNIC–00216) **Studies of irradiation sterilization for single infusion device.** Chen Ruyan; Wang Keqin; Lu Zongmeng; Xiao Fenyuan; Xie Meizhi. China Nuclear Information Centre, Beijing, BJ (China). May 1988. 11p. (In Chinese). Order Number DE90604926. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

In practice of irradiation sterilization for single infusion device, object bacteria were selected and then their radiosensitivity were tested on the basis of practical production and irradiation environment. In view of the cylinder source and the static irradiation form, the dose rate of irradiation field and the dose distribution and uniformity in product box were measured in order to control sterilization quality. Through the measurements of material properties for irradiated infusion device and the test of causing rabbit fever as well as the survey of clinical practice, it was verified that the irradiation apparatus, the irradiation process and the product material etc. can satisfy the demands of sterilixzation and praction.

53425 (PB–89-208391/XAB) **Economic analysis of electron accelerators and cobalt-60 for irradiating food. Technical bulletin.** Morrison, R.M. Economic Research Service, Washington, DC (USA). Commodity Economics Div. Jun 1989. 45p. (USDA/TB–1762). Available from NTIS, PC A03/MF A01.

Average costs per pound of irradiating food are similar for the electron accelerator and cobalt-60 irradiators analyzed in the study, but initial investment costs can vary by $1 million. Irradiation costs range from 0.5 to 7 cents per pound and decrease as annual volumes treated increase. Cobalt-60 is less expensive than electron beams for annual volumes below 50 million pounds. For radiation-source requirements above the equivalent of 1 million curies of cobalt-60, electron beams are more economical.

53426 **Food irradiation. Hearing before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, One Hundredth Congress, First Session on H.R. 956, June 19, 1987.** Serial No. 100-81. 280p. Government Printing Office, Washington, DC (US) (1988).

Government officials and representatives from health and food service groups were among those testifying on H.R. 956, the Food Irradiation Safety and Labeling Requirement Act of 1987. The area of most concern was to evaluate the actions of the Food and Drug Administration in approving the use of food irradiation technology and to discuss whether the FDA decision was the right one.

Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. 1983. 10p. Order Number DE90606459. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

A long-term radiation ecology research project called Field Irradiator - Gamma (FIG) began at the Whiteshell Nuclear Research Establishment in 1968. The experimental area is in southeastern Manitoba and is located on the western edge of the Precambrian shield. The project studies the ecological effects continuous exposure to a gradient of gamma radiation has on a mixed boreal forest ecosystem. The gradient ranges from 1 to 460,000 times the natural background radiation level. This paper describes the forest, the gamma irradiator and its radiation field, and the research program.

This progress report is a summary of the research performed. Part I deals with mechanisms of photoemission from organic particulates, theoretical studies of the photoemission of electrons into atmospheres containing scavenger molecules, and theoretical studies of the possible existence of excitonic ions. Particularly noteworthy are our most recent results on the effects of water monolayers on the photoemission of electrons from adenine which show that the emission of electrons may take place over time intervals as long as several tenths of picoseconds after the absorption of a photon. Part II deals with the mechanisms of electrolytic reactions which occur at solid anthracene/aqueous electrolyte interfaces. Part III describes our most recent results on the physico-chemical interactions of mutagenic and carcinogenic polycyclic aromatic hydrocarbon (PAH) derivatives with nucleic acids. Within the last year, we stressed the influence of the structure of the nucleic acid based which are the building blocks of DNA; next year, we plan to investigate the role of the structural parameters of PAH molecules on these interactions which should provide a deeper understanding of the factors which distinguish mutagenic from non-mutagenic compounds. Finally, in Part IV we briefly summarize our project on mechanisms of damage induced by ionizing radiation, and mechanisms of protection from such damage by exogenous molecules. Synthetic oligonucleotides of well defined base composition and sequence, as well as viral supercoiled DNA is being used.

53431 (DOE/ER/60539–T1) **The oncogenic action of ionizing radiation on rat skin: Progress report, February 1, 1987–January 31, 1990.** Burns, F.J.; Garte, S.J. New York Univ., NY (USA). Dept. of Environmental Medicine. [1989]. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60539. (COO–3380-60). Order Number DE90001535. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Progress is described in three areas corresponding to carcinogenesis and DNA strand breaks in rat skin following exposure by the neon ions or electrons; oncogene activation in radiation-induced rat skin cancers; and DNA strand breaks in the epidermis as a function of radiation penetration. Approximately 200 rats were exposed to the neon ion beam at the Bevalac in Berkeley, CA. The carcinogenicity of energetic electrons (2.0 Mev) was determined for comparison with the neon ion results. For double skin thickness irradiations electrons there was an unusually large excess of connective tissue tumors, fibromas and sarcomas. Presumably the latter tumors are occurring, because more connective tissue is exposed by deeply penetrating, i.e., energetic, beams. 13 refs.

53432 (IAEA-TECDOC–516, pp. 233-256) **Acute effects of radiation exposure following the Chernobyl accident: Immediate results of radiation sickness and outcome of treatment.** Gus'kova, A.K.; Nadezhina, N.M.; Barabanova, A.V.; Baranov, A.E.; Gusev, I.A.; Protasova, T.G.; Boguslavskij, V.B.; Pokrovskaya, V.N. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

Effect of penetrating radiation evenly distributed over the whole body was the main cause of general clinical syndromes typical for dose range 100-1600 rads (1-16 Gy): bone marrow, intestinal and transitional forms or combinations of these syndromes. According to gamma spectrometry of blood and urine samples and posthumous examination of organs and tissues, max concentrations of iodine-131 in the body were 1-5 mCi (for various patients); for caesium-137 and 134 the figures were 2-2.5 mCi, and contamination by cerium-144 did not exceed 30 mCi (about 95% of cerium activity was in the lungs). Other nuclides did not exceed their MPCs. For personnel on site at the time of the accident, the average exposure dose to the lungs was 0.2 Gy, to the thyroid gland 2.5 Gy, and to the whole body about 0.05 Gy. A whole-body dose of 0.7 Gy may, as a general guide, be regarded as the minimum dose causing insignificant but consistent and individually significant changes in the blood picture characteristic of acute radiation sickness of the first degree. Variant 1 of a diagnostic programme designed to ensure a uniform approach to the diagnosis of first degree acute radiation sickness has been established. Of 21 patients with acute radiation sickness of the third degree (dose range 4-6 Gy), 14 survived. All patients with acute radiation sickness of the fourth degree died except for one. Generally, death resulted from a combination of clinical syndromes, primarily the intestinal and bone marrow syndromes with total or subtotal skin damage. Recovery of haemopoiesis was extremely active: in 84% of cases, the normal blood picture was re-established after 1 to 1 1/2 years. Indicators of fitness for work returned after 8-9 weeks in patients with first and second degree acute radiation sickness and were high one year after exposure. Some who suffered acute radiation sickness are now working at the Chernobyl plant

53433 (IAEA-TECDOC–516, pp. 257-266) **Transplantation of bone marrow in victims of the Chernobyl accident.** Baranov, A.E. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

Bone marrow transplants were carried out in 13 patients suffering from acute irradiation sickness after the Chernobyl accident. Only blood relations of the patients were used as donors. The number of bone marrow cells transplanted must be at least $2x10^8$ per kilogram of recipient weight. The experience of the present bone marrow transplants has shown defects in clinical methods of early diagnosis (during the first 7-10 days after exposure) of acute radiation injuries to the skin, intestine and lungs which are incompatible with survival. Another problem with bone marrow transplants for patients suffering from acute radiation sickness is to determine to what extent the depression of marrow activity is irreversible. Spontaneous regeneration of myelopoiesis was observed 22-30 days after exposure in patients who had received doses of 7-9 Gy. A lapse of this order before the onset regeneration is therefore, in principle, compatible with survival under the conditions of modern support therapy. Thus, the belief that prolonged acute radiation pancytopenia which is incompatible with survival starts already at doses of 5-6 Gy is evidently incorrect, at least for the relatively low exposure dose rates experienced by this group of victims. The results of bone marrow transplants in victims of the Chernobyl accident suggest that, in future, the following rules should be observed in transplanting human bone marrow to victims of acute radiation sickness: (1) Only HLA-identical transplants should be carried out; and (2) HLA-identical bone marrow transplants should be carried out only in patients who have received whole body doses of gamma radiation of 9.0 Gy or more. (author). 1 tab.

53434 (IAEA-TECDOC–516, pp. 267-272) **Rehabilitation of victims of acute radiation sickness.** Bebeshko, V.G.; Prevarskij,

B.P.; Khalyavko, I.G.; Shimelis, I.V.; Belyj, D.A. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

Two hundred and nine victims of acute radiation sickness following the Chernobyl accident are under observation (first degree - 134, second degree - 54, third degree - 20 and fourth degree - 1). In 57 (42.5%) of the patients having suffered first degree acute radiation sickness, work capability was reduced by 25%; 9 persons with first degree acute radiation sickness were classified as invalids of the second and third category. In the group with second degree acute radiation sickness, a reduction of the work capability was observed in all cases. In the group with third degree, 100% had signs of disability. In carrying out rehabilitation and prophylactic measures aimed at reducing social risk factors, considerable attention has been given to publicizing a healthy way of life. At present, professional reorientation has been or is being given to the majority of patients. An analysis of the results of rehabilitation measures carried out during the year shows a gradual improvement in general health and an improvement in working capabilities. However, the symptomatology of injuries to individual organs and systems remains unchanged. (author). 1 tab.

International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

The Chernobyl accident caused, in addition to external exposure to radiation, inhalation and oral intake of the main dose-forming radionuclides: caesium-134 and 137 and iodine-131. Taken together, the adverse factors emerging from the accident at Chernobyl manifested themselves first and foremost in vegetative dysfunction, disturbances of neurovascular regulation and changes in the reactivity of the immune system. The significantly increasing migration of the population and its inhomogeneous nature, especially in the groups of reproductive age, are bringing about changes in the structure of the population and in family planning strategies. In the regions studied, dynamic statistical indicators of the spread of infectious diseases have reflected the general trend in our country, namely towards a reduction of such diseases. In 1986, the frequency of acute intestinal infection dropped in a number of regions by factors of 1.5-8. In the Ukraine a special clinical register of pregnant women and babies from the regions under study is being kept. The initial document includes 1,630 pregnant women. No significant departures from the norm have been found in the course of these pregnancies and births, or in the condition of the new-born babies. Detailed clinical examination of 416 babies showed that the condition of the vast majority of them at birth corresponded to a score of 7-8 on the Apgar scale. Examination of the reproductive system in 417 women of child-bearing age did not reveal any abnormalities. We are now at the beginning of a second observation period, associated with the development of somatic stochastic effects. It will be necessary to carry out further retrospective and prospective analyses of the incidence of disease in various population groups, taking into account age, sex and profession, as well as medical, social, geographical, ecological and other factors affecting the organism. (author).

53436 (IAEA-TECDOC–516, pp. 293-298) **State of the pituitary and thyroid system in children at various times after exposure to radiation as a result of the Chernobyl accident.** Benikova, E.A.; Bol'shova, E.V.; Zvonova, I.A. and others. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

A clinical/laboratory examination was made of children from the age of 1-14 years from the area of high radiation. The examination was carried out on a continuous basis, beginning in the first half of May 1986 and is still in progress. At no stage was there any clinical evidence of thyroid dysfunction, but, in a significant proportion of the children an increase in the size of the thyroid gland was noted. In May and June 1986, 77.5% of the children had a first or second degree enlargement of the thyroid gland. At the same time, there was an increase in the level of T_4 in the blood: 85.20 +- 7.36 nmole/L to 348.33 +- 38.26 nmole/L. In the subsequent stages, a gradual normalization of these parameters was noted. No other significant functional or organic disorders of the pituitary-thyroid system were detected. (author).

53437 (IAEA-TECDOC–516, pp. 299-307) **Medical care during the radiation accident (^{137}Cs) in Brazil, 1987.** Selidovkin, G.D. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

The report describes the activities of diagnosis, prognosis and treatment of overexposed individuals during the radiological accident of Goiania in Brazil. In particular it describes the handling of 17 individuals who suffered acute radiation syndromes. After summarizing the development of the accident the report describes the radiation injuries of people, the biological dosimetry methods used for the diagnosis of doses and the methods for decontamination. The treatment and the response of the patients is also described in detail. (author).

53438 (IAEA-TECDOC–516, pp. 345-350) **Preparation of an all-union distribution register of persons exposed to the effects of radiation as a result of the Chernobyl accident, with a view to evaluating exposure doses and making a long term public health forecast.** Tsyb, A.F.; Dedenkov, A.N.; Ivanov, V.K. and others. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988. (CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

The all-Union distribution register is a multilevel information and control system covering almost all parts of the country. This register is to be kept for many decades: it is a large-scale project of great significance for the selection of strategies and tactics for the development of nuclear power, for the use of ionizing radiations in the economy, and for effective and complete solutions to radiation safety problems. Smooth and well-co-ordinated work by all specialists and organizations involved in its preparation is therefore essential. (author).

53439 (IAEA-TECDOC–516, pp. 351-364) **Organization and planning of work involved in the long term clinical observation of children with a high radiation risk.** Bugaev, V.N.; Bomko, E.I.; Bruslova, E.M.; Avramenko, A.I.; Buldakov, L.A.; Rubel, N.F. International Atomic Energy Agency, Vienna (Austria); Ministerstvo Zdravookhraneniya SSSR, Moscow (USSR); All-Union Scientific Centre of Radiation Medicine, Kiev (Ukrainian SSR). Jul 1988.

(CONF-8805334–: All-Union conference on medical aspects of the Chernobyl accident, Kiev (Ukrainian SSR), 11-13 May 1988). In *Medical aspects of the Chernobyl accident. Proceedings of an all-union conference held in Kiev, 11-13 May 1988.* Order Number DE90604939. Available from NTIS (US Sales Only), PC A17/MF A01 - OSTI; INIS.

Operation of the register involves analysing the basic parameters characterizing the health of children, carrying out epidemiological studies on various types of disease, refining dose parameters and reconstructing actual doses, establishing spatial and temporal dose distribution patterns, providing systematic information in support of the register, and so on. By 16 May 1986, thyroid dose monitoring had been carried out and detailed blood analyses performed on 140,000 children, who were also given complete medical examinations by specialists. In 95% of these children, the calculated caesium intake at the end of the year following the accident was less than 1 rem. Further information support for the register of the child population with the same comprehensive volume of medical information will make it possible to study the teratogenic effects of ionizing radiation and abnormal growth and development of children exposed at an early age, and to determine risk coefficients as a function of time, teratogenesis and cancer of the more sensitive tissues, as well as the effects of small doses of ionizing radiation. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIOTHERAPY/delayed radiation effects; RADIOTHERAPY/side effects; ADOLESCENTS; BIOLOGICAL LOCALIZATION; BONE TISSUES; CHILDREN; INTEGRAL DOSES; PATIENTS; RADIOTHERAPY; SARCOMAS

53458 (INIS-SU–116/A, pp. 60-63) **Assessment of severity of delayed skin radiation injuries following acute local irradiation according to dosimetric data.** Kharchenko, L.P. (Institut Biofiziki, Moscow (USSR)). Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. 1 tab. RADIOTHERAPY/delayed radiation effects; RADIOTHERAPY/dosimetry; SKIN/radiation injuries; PATIENTS; RADIOTHERAPY; DOSIMETRY; SKIN

53459 (INIS-SU–116/A, pp. 68-70) **Assessment of factors change of rheovasogram before and after conservative treatment in patients with secondary (radiation) edema of upper limbs.** Korobchenko, Z.A.; Khmelevskaya, N.A.; Zubova, N.D. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIATION INJURIES/biomedical radiography; RADIOTHERAPY/side effects; ARMS; BLOOD VESSELS; EDEMA; IMAGES; MAMMARY GLANDS; NEOPLASMS; PATIENTS; RADIOTHERAPY

53460 (INIS-SU–116/A, pp. 70-73) **Functional state of cardiovascular system at delayed periods following radio- and chemotherapy.** Tovarushkin, V.I.; Astapov, B.M.; Giseva, Z.A. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. HEART/biomedical radiography; RADIOTHERAPY/side effects; BIOLOGICAL FUNCTIONS; CARDIOGRAPHY; CARDIOVASCULAR DISEASES; CHEMOTHERAPY; HEART; INTEGRAL DOSES; PATIENTS; RADIOTHERAPY; ULTRASONIC WAVES

53461 (INIS-SU–116/A, pp. 66-68) **Treatment of rectovaginal fistulae following radiation treatment of uterine and cervix uteri carcinoma.** Berdov, B.A.; Abramyan, S.G. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. FISTULAE/post-irradiation therapy; RADIATION INJURIES/fistulae; RADIOTHERAPY/side effects; CARCINOMAS; FISTULAE; PATIENTS; RADIOTHERAPY; UROGENITAL SYSTEM DISEASES

53462 (INIS-SU–116/A, pp. 73-76) **Delayed radiation pericarditis.** Astapov, B.M.; Yuzhakova, M.Z. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIOTHERAPY/delayed radiation effects; RADIOTHERAPY/side effects; CARDIOGRAPHY; CARDIOVASCULAR DISEASES; HEART; NEOPLASMS; PATIENTS; RADIOTHERAPY

53463 (INIS-SU–116/A, pp. 80) **Radiation fibroses and pulmonitises in patients with Hodgkin's disease of 3-d stage in various fractionation regimes.** Il'in, N.V. (Tsentral'nyj Nauchno-Issledovatel'skij Rentgeno-Radiologicheskij Inst., Leningrad (USSR)); Korytova, L.I.; Semich, V.N.; Lovyagin, E.V.; Kaganskij, V.L.; Grosheva, E.V. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIOTHERAPY/side effects; DELAYED RADIATION EFFECTS; HODGKINS DISEASE; LUNGS; PATIENTS; RADIOTHERAPY; RESPIRATORY SYSTEM DISEASES

53464 (INIS-SU–116/A, pp. 76-79) **Delayed lung radiation injuries following radiation treatment of mammary gland cancer.** Zorina, L.A.; Kuz'mina, N.S.; Romagin, V.K.; Khmelevskaya, N.A. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIATION INJURIES/lungs; RADIOTHERAPY/side effects; CHEMOTHERAPY; DELAYED RADIATION EFFECTS; MAMMARY GLANDS; NEOPLASMS; PATIENTS; LUNGS; RADIOTHERAPY

53465 (INIS-SU–116/A, pp. 81-82) **Examination of nervous-muscular system and peripheral blood circulation in patients radically treated in case of mammary gland cancer.** Gundareva, I.D. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIOTHERAPY/side effects; BLOOD CIRCULATION; INTEGRAL DOSES; MAMMARY GLANDS; MUSCLES; NEOPLASMS; NERVES; PATIENTS; RADIOTHERAPY

53466 (INIS-SU–116/A, pp. 83-84) **Dynamics of rheological blood properties in patients with radiation edema of upper limbs in the course of conservative treatment.** Timchenko, V.G. (Khar'kovskij Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Kharkov (Ukrainian SSR)); Moroz, V.A.; Shapovalov, S.V. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. BLOOD PLASMA/radiation injuries; RADIOTHERAPY/side effects; ARMS; EDEMA; MAMMARY GLANDS; NEOPLASMS; PATIENTS; RADIOTHERAPY

53467 (INIS-SU–116/A, pp. 84-86) **Complex clinico-biochemical assessment of development of delayed radiation injuries of connective tissue.** Frenkel', L.A. (Khar'kovskij Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Kharkov (Ukrainian SSR)); Uzlenkova, N.E.; Beketova, S.N.; Gajsenyuk, L.A. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/connective tissue; RADIOTHERAPY/side effects; BIOCHEMISTRY; BONE TISSUES; DELAYED RADIATION EFFECTS; PATIENTS; RADIOTHERAPY; SKIN

53468 (INIS-SU–116/A, pp. 89-90) **Radiodiagnosis of lymph flow disturbances in patients with delayed radiation injuries of soft tissues.** Moroz, V.A. (Khar'kovskij Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii, Kharkov (Ukrainian SSR)). Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. LYMPHATIC SYSTEM/radiation injuries; RADIOTHERAPY/side effects; BIOMEDICAL RADIOGRAPHY; DELAYED RADIATION EFFECTS; PATIENTS; RADIOTHERAPY; TISSUES

53469 (INIS-SU–116/A, pp. 90-93) **Radiodiagnosis of radiation injuries of limb bones in adults.** Gun'ko, R.I. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. DIAGNOSIS/radiation injuries; RADIOTHERAPY/side effects; ADULTS; BIOMEDICAL RADIOGRAPHY; BONE FRACTURES; DIAGNOSIS; INTEGRAL DOSES; LIMBS; NECROSIS; NEOPLASMS; OSTEOMYELITIS; OSTEOPOROSIS; PATIENTS; RADIOTHERAPY

53470 (INIS-SU–116/A, pp. 93-95) **Angiogenic periostosis of crus bones following radiotherapy of skin melanoma.** Gun'ko, R.I.; Krasnov, A.S. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/skeleton; RADIOTHERAPY/side effects; BIOMEDICAL RADIOGRAPHY; BLOOD VESSELS; FRACTIONATED IRRADIATION; INTEGRAL DOSES; MELANOMAS; PATIENTS; SKELETON; RADIOTHERAPY; SKIN; X RADIATION

53471 (INIS-SU–116/A, pp. 95-96) **Radiation injuries of vertebrae in esophagus cancer treatment.** Gerasimyak, V.G. (Tsentral'nyj Nauchno-Issledovatel'skij Rentgeno-Radiologicheskij Inst., Leningrad (USSR)). Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/vertebrae; RADIOTHERAPY/side effects; BIOMEDICAL RADIOGRAPHY; ESOPHAGUS; INTEGRAL DOSES; NEOPLASMS; PATIENTS; VERTEBRAE; RADIOTHERAPY

53472 (INIS-SU–116/A, pp. 97-99) **Dimexide (dmso) for prophylaxis and treatment of local radiation injuries.** Bardychev, M.S. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. DMSO/radiation injuries; RADIOTHERAPY/side effects; DMSO; PATIENTS; RADIOTHERAPY; SKIN

53473 (INIS-SU–116/A, pp. 99-101) **Treatment of radiation ulcers of skin and adjacent soft tissues in controlled abactrial medium.** Kim, Yu.A. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/ulcers; RADIOTHERAPY/side effects; ALBUMINS; DELAYED RADIATION EFFECTS; GAMMA RADIATION; IODINE 131; MICROORGANISMS; PATIENTS; ULCERS; RADIOPHARMACEUTICALS; RADIOTHERAPY; SKIN; TISSUES; X RADIATION

53474 (INIS-SU–116/A, pp. 101-103) **Local radiation injuries.** Savinykh, L.M. (Uzbekskij Nauchno-Issledovatel'skij Inst. Onkologii i Radiologii, Tashkent (USSR)). Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/skin; RADIOTHERAPY/delayed radiation effects; RADIOTHERAPY/side effects; BIOMEDICAL RADIOGRAPHY; GAMMA RADIATION; INTEGRAL DOSES; PATIENTS; SKIN; RADIOTHERAPY; X RADIATION

53475 (INIS-SU–116/A, pp. 103-104) **Microsurgical autoplastictransplantation of greater omentum for plasty of radiation injuries of integmentary tissues.** Milanov, N.O. (Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR). Vsesoyuznyj Nauchnyj Tsentr Khirurgii); Bardychev, M.S.; Shilov, B.L. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst.

Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. 1 tab. RADIATION INJURIES/plastic surgery; RADIATION INJURIES/transplants; RADIOTHERAPY/side effects; BIOLOGICAL LOCALIZATION; MESENTERY; NEOPLASMS; PATIENTS; TRANSPLANTS; RADIOTHERAPY; ULCERS

53476 (INIS-SU–116/A, pp. 105-107) **Treatment of delayed radiation injuries of lungs.** Zorina, L.A. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/chemotherapy; RADIATION INJURIES/post-irradiation therapy; RADIOTHERAPY/side effects; DELAYED RADIATION EFFECTS; DRUGS; FIBROSIS; LUNGS; PATIENTS; CHEMOTHERAPY; RADIOTHERAPY

53477 (INIS-SU–116/A, pp. 107-109) **Treatment of operative wounds because of breast cancer with preoperative radiotherapy.** Shamilov, A.K. (Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR). Onkologicheskij Nauchnyj Tsentr); Dmuzhakulyeva, S.I.; Nechushkin, M.I.; Tsikhiseli, G.R. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIOTHERAPY/side effects; ENZYMES; FRACTIONATED IRRADIATION; INTEGRAL DOSES; MAMMARY GLANDS; NEOPLASMS; PATIENTS; RADIOTHERAPY; SURGERY

53478 (INIS-SU–116/A, pp. 109-111) **Use of cozilat preparation as enteral nutrition for patients with late radiation injuries of colon.** Artamonov, Yu.I.; Kurpesheva, A.K. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/large intestine; RADIOTHERAPY/side effects; CARCINOMAS; DRUGS; INTEGRAL DOSES; NUTRITION; PATIENTS; RADIOTHERAPY; UROGENITAL SYSTEM DISEASES

53479 (INIS-SU–116/A, pp. 111-113) **Treatment results of colon radiation ulcers.** Kholin, V.V. (Tsentral'nyj Nauchno-Issledovatel'skij Rentgeno-Radiologicheskij Inst., Leningrad (USSR)); Lubenets, Eh.N.; Vinokurov, V.L. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. 1 tab. RADIATION INJURIES/large intestine; RADIOTHERAPY/side effects; CARCINOMAS; CHEMOTHERAPY; DRUGS; PATIENTS; RADIOTHERAPY; ULCERS; UROGENITAL SYSTEM DISEASES

53480 (INIS-SU–116/A, pp. 113-115) **Peculiarities of course and treatment of radiation cystitis in the process of concominatant radiotherapy including intracavitary gamma-therapy at Agat-B unit in patients with cevrix uteri carcinoma.** Vishnevskaya, E.E. (Nauchno-Issledovatel'skij Inst. Onkologii i Meditsinskoj Radiologii, Minsk (Byelorussian SSR)). Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/bladder; RADIOTHERAPY/side effects; CARCINOMAS; GAMMA RADIATION; IRRADIATION DEVICES; PATIENTS; BLADDER; RADIOTHERAPY; UROGENITAL SYSTEM DISEASES

53481 (INIS-SU–116/A, pp. 115-117) **Lazer puncture in combined treatment of secondary (radiation) edema of upper limbs.** Degtyareva, A.A.; Kuz'mina, E.G.; Evtifeeva, E.S. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/edema; RADIATION INJURIES/limbs; RADIOTHERAPY/side effects; LASER RADIATION; MAMMARY GLANDS; NEOPLASMS; PATIENTS; POST-IRRADIATION THERAPY; EDEMA; LIMBS; RADIOTHERAPY

53482 (INIS-SU–116/A, pp. 117-118) **Reflex therapy in treatment of secondary (radiation) neurologic disorders.** Zubova, N.D. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/nervous system diseases; RADIOTHERAPY/side effects; BIOLOGICAL LOCALIZATION; FRACTIONATED IRRADIATION; INTEGRAL DOSES; NEOPLASMS; PATIENTS; RADIOTHERAPY; REFLEXES

53483 (INIS-SU–116/A, pp. 119-121) **Immune indices and common protein in interstitial fluid as evaluation of treatment effect of patients with secondary (radiation) edema of limbs using laser puncture.** Kuz'mina, E.G.; Degtyareva, A.A.; Rogova, N.M.; Doroshenko, L.N. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

TB-02620.

Short note. RADIATION INJURIES/edema; RADIOTHERAPY/side effects; BODY FLUIDS; CHEMOTHERAPY; DELAYED RADIATION EFFECTS; FIBROSIS; IMMUNOGLOBULINS; LASER RADIATION; MAMMARY GLANDS; NEOPLASMS; PATIENTS; EDEMA; RADIOTHERAPY

53484 (INIS-SU–116/A, pp. 121-123) **Experience on electropuncture application in treatment of late radiation ulcers.** Khenkin, E.V. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation*

injuries. Summaries of reports. Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIATION INJURIES/ulcers; RADIOTHERAPY/side effects; DELAYED RADIATION EFFECTS; ELECTRIC CURRENTS; NEOPLASMS; PATIENTS; ULCERS; RADIOTHERAPY

53485 (INIS-SU–116/A, pp. 123-124) **Laser therapy in treatment of radiation injuries in children with malignant tumors of head and neck.** Lobanov, G.V. (Akademiya Meditsinskikh Nauk SSSR, Moscow (USSR). Onkologicheskij Nauchnyj Tsentr); Polyakov, V.G. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). In *Diagnosis and treatment of local delayed radiation injuries. Summaries of reports.* Order Number DE90705925. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02620.
Short note. RADIATION INJURIES/head; RADIATION INJURIES/neck; RADIOTHERAPY/side effects; CHILDREN; LASER RADIATION; PATIENTS; POST-IRRADIATION THERAPY; HEAD; NECK; RADIOTHERAPY; RHABDOMYOSARCOMAS

53486 (INIS-SU–116/A, pp. 124-126) **Radiation injuries of exterior genital organs.** Kiseleva, M.V.; Petrik, V.D. Akademiya Meditsinskikh Nauk SSSR, Obninsk (USSR). Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii. 1988. (In Russian). (CONF-8806432–: All-Union conference on local radiation damage diagnostics and treatment, Obninsk (USSR), 28-29 Jun 1988). TB-02943.
Combined action of interferon synthesis inductors with irradiation chemotherapeutic preparations, radiosensitizing agents is studied. It is shown that all interferon synthesis inductors tested did not cause any substantial retardation of transplanted neoplasms even in little mice; under combined action with irradiation they increase neoplasm irradiation efficiency. It is ascertained that the given effect is observed in animals at the background of high interferon titers in blood serum, caused by inductors, and at the background of high interferon titers in neoplasms which exists there initially. It is assumed that data on interferon titers are not information content to judge about interferon synthesis inductor efficiency.

TB-02943.
Autitumoral antimetastatic effect of certain interferon synthesis inductors of various classes are studied including poly I, poly Ts, tyloron, curantyl in combination with irradiation using sarcoma-37 and Lewis carcinoma models. When investigating different synthetic interferon synthesis inductors differing by synthesis terms and endogenous interferon titers, an insulficient radiosensitizing effet on sarcoma-37 tumor is detected. The most obvious effect of the same inductors was observed in Lewis carcinoma: the number of secondary tumors (metastases) is 2.0-2.5 times reduced when the inductor is injected a day before irradiation. 11 refs.; 4 tabs.

53492 (INIS-SU–131/A, pp. 52-57) **Effect of sodium nucleinate on antibody formation in irradiated animals tumor-carriers.** Karpova, N.A.; Surinov, B.P. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02943.
Effect of sodium nucleinate on antibody formation in mice at different stages of transplanted tumor growth and under total irradiation with ionizing radiation is studied. It is shown that sodium nucleinate possesses stimulating abilty both in relation to intact animals and to irradiated tumorcarriers. This stimulation is obviously conditioned by an increase of functional activity of immunocompetent cells and not by their content in spleen. Depression of function or relative content of suppressive cells both antigen-dependent and tumor-associated can be one of the mechanisms of such a stimulation. Investigation results testing tothe prospects of sodium nucleinate application under radial and combined treatment of oncologic patients. 8 refs.; 2 tabs.

Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02943.

Comparative investigation into efficiency of various doses and methods of sodium nucleinate introduction for antibody formation of intact animals and after ionizing radiation effect is conducted. Sufficient differences in efficiency of such methods of injection as single intraperitoneal, single peroral in large doses or fractional peroral ones are demonstrated. Advantaes of peroral fractional injection are obvious. It is assumed that under different injecion methods mechanisms of immunostimulating effect of this preparation can be different. 5 refs.; 2 tabs.

53495 (INIS-SU–131/A, pp. 65-68) **Effect of immunomodulators on immunoreactivity recovery following combined effect of radiation and thermal injury.** Makarov, G.F.; Agapova, G.G. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
TB-02943.

It is shown that certain immunomodulators products a sufficient effect on immunoreactivity recovery only after combined effect of radiation and thermal injury in non-lethal doses. It is notable that in this case the antiboby formation level exceeds sufficiently the similar index even in healthy animals. Early injection of thymoptine immunostimulator as well as its combination with cystamine radioprotector are inefficient for antibody formation recovery under combined radiation-thermal injury. 4 refs.

53496 (INIS-SU–131/A, pp. 68-71) **Efficiency of early application of immunomodulators in combined effect of radiation and thermal injury.** Makarov, G.F. The university program of the tritium study in the Special Research Project of Nuclear Fusion (1980-1989) is now on its 9th year. The study's aim is to assess tritium risk on man and environment for development of Japanese Nuclear Fusion Program. The tritium study begun by establishing various tritium safe-handling devices and methods to protect scientists from tritium contamination. Then, the tritium studies were initiated in three areas: The first was the studies on biological effects of tritiated water, where their RBE values, their modifying factors and mechanisms were investigated. Also, several human monitoring systems for detection of tritium-induced damage were developed. The second was the metabolic studies of tritium, including a daily tritium monitoring system, methods to enhance excretion of tritiated water from body and means to prevent oxidation of tritium gas in the body. The third was the study of environmental tritium. Tritium levels in environmental waters of various types were estimated all-over in Japan and their seasonal or regional variation were analyzed. Last two years, the studies were extended to estimate tritium activities of plants, foods and man in Japan. (author).

53499 (IPPJ-REV–3, pp. 46-58) **High specific activity of organically bound tritium in pine needles and search for its cause in the environment.** Takashima, Yoshimasa (Tohoku Univ., Sendai (Japan). Faculty of Science); Momoshima, Noriyuki; Kaji, Toshio. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). Available from NTIS (US Sales Only), PC A14/MF A01.

In order to measure low level tritium in biological materials, an improved method was established. This method was applied to a number of pine needles. Tritium in pine needles is divided into two categories, i.e., tritium in tissue free water (TFWT) and organically bound tritium (OBT). The former is easily collected by freeze drying, but the latter requires combustion of dried samples. The combustion water is collected in a trap immersed in dryice-alcohol. The water thus collected is used for scintillation counting after distillation. We measured tritium concentrations in pine needles collected from 21 locations in all over Japan which are considered to be far enough removed from the influences of nuclear facilities. In addition to them, the same procedures were applied to pine needles collected in the vicinity of nuclear facilities. Tritium concentrations in pine needles of ordinary locations are higher in organic matter than in tissue free water with the ratio, ca. 1.5. The ratios are quite variable for the pine needles in the vicinity of nuclear installations suggesting that this method is useful for the environmental monitoring. The cause for high specific activity of organically bound tritium is not fully confirmed. However, we consider that this excess OBT may be attributed to direct assimilation of HT that presents in the atmosphere with extremely high specific activity. (author).

53500 (IPPJ-REV–3, pp. 64-73) **Controlled environment estimations of HT uptake by vegetation.** Murphy, C.E. Jr. (Sarannah River Lab., Aiken, SC (USA)). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133*

on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center. Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

A controlled environment system was constructed to determine the rate of uptake of tritium from atmospheric tritiated molecular hydrogen (HT). The system provided control of air temperature, air humidity, light intensity, and the concentration of HT in the air. Exposure of representative crop species for a period of one hour indicates a very low rate of oxidation of HT by the leaves of the plants. Deposition velocities were calculated to average 2×10^{-6} cm/s. Rates of incorporation of tritium into the organic fraction of the plants was a factor of 30 less than the rate of oxidation. These results suggest that the uptake of HT by plants is not a major source of dose to man following accidental HT releases. (author).

53501 (IPPJ-REV–3, pp. 74-83) **Behavior of organically bound tritium in some plants under equilibrium and non-equilibrium environmental conditions.** Inoue, Yoshikazu (National Inst. of Radiological Sciences, Chiba (Japan)); Iwakura, Tetuo. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

To understand behavior of organically bound tritium (OBT) in the environment, concentration ratios of OBT to tissue free water tritium (TFWT) were compared between a rice plant grown under equilibrium condition and a pine tree grown under non-equilibrium condition. The OBT to TFWT ratio of rice was 0.69+-0.38 as an average for the polished rice harvested in the whole Japan in 1985. On the contrast, the ratio of pine needles collected near nuclear facilities changed with time between 1 and 2. It is concluded that the concentration ratio of OBT to TFWT in the plant keeps less than unity under the equilibrium condition, but it is possible to become larger than unity under the non-equilibrium condition, because OBT has longer retention time in the plant than TFWT. (author).

53502 (IPPJ-REV–3, pp. 84-87) **Tritium content in Japanese bodies.** Ujeno, Yowri (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.); Aoki, Toru; Yamamoto, Keiichi; Kurihara, Norio. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Tritium contents of tissue free water (TFWT) and tissue bound water (TBT) in 94 tissues from 32 autopsied Japanese bodies were measured. TFWT was measured in water removed by a freeze drying method and TBT was measured in water obtained by a combustion method with Pt and a high quality oxygen gas. Tritium was counted with two instruments which can detect tritium against background levels. The TFWT averages were 2.6 Bq/l in the brain, 3.3 Bq/l in the lung, 3.3 Bq/l in the liver, 6.1 Bq/l in the kidneys, 2.6 Bq/l in the muscle and 3.8 Bq/l in the spleen. TBT was 16.7 Bq/l in the lung and 15.5 Bq/l in the liver of one body. It is assumed that one of the reasons for obtaining such high TBTs is contamination by unknown substances which have a similar scintillation spectrum as that of tritium. (author).

53503 (IPPJ-REV–3, pp. 88-93) **Transfer of fallout ^{3}H from diet to human in Akita, Japan.** Hisamatsu, Shun'ichi (Akita Univ. (Japan). School of Medicine); Takizawa, Yukio; Abe, Touru; Ito, Mikio; Ueno, Kaoru; Katsumata, Tei'ichi; Sakanoue, Masanobu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Tritium concentrations in diet at Akita City, and in human tissues from general population in Akita Prefecture were analyzed to study fallout ^{3}H transfer from diet to human body. The specific activity ratios of tissue bound ^{3}H to free water ^{3}H in the diet and human tissues were found to be close to unity in significant contrast with those reported in Italy and U.S.A. The free water ^{3}H concentrations in human tissues agreed well with the those in diet including tap water. The specific activity ratio of tissue bound ^{3}H to free water ^{3}H in human tissues was slightly lower than that in diet, and agreed with the predicted value with the four compartment model. (author).

53504 (IPPJ-REV–3, pp. 99-106) **Bioassay of hair for estimation of body burden by tritium exposure.** Takeda, Hiroshi (National Inst. of Radiological Sciences, Chiba (Japan)); Iwakura, Tetsuo. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

For accurate estimation of radiation dose to human body from tritium exposure, it is needed to assess the concentration of tritium organically bound to the tissue constituents(OBT) as well as body water tritium. Since hair is an easily accessible tissue, it seems to be interesting to study the possibility of using hair for this purpose. In the present study, the pattern of tritium incorporation into hair and the quantitative relationship between OBT content in hair and in other internal tissues were investigated in rats exposed singly or continously to tritiated water, tritiated leucine and tritiated glycine. The rate of tritium incorporation into hair was slower than that into other tissues and the maximum concentrations were found on the 15-30th day after a single ingestion. The alterations in the concentration of OBT in internal tissues due to the difference of chemical form of ingested tritium were reflected on the OBT concentration in hair. Especially, the OBT content in hair under the condition of continuous exposure was almost the same as that in other tissues. These findings indicate the validity of hair analysis as a means for assessing OBT deposition in the body or tissues. (author).

53505 (IPPJ-REV–3, pp. 59-63) **Fixation of tritium gas by a pine tree and its surroundings.** Ichimasa, Michiko (Ibaraki Univ., Mito (Japan). Faculty of Science); Ichimasa, Yusuke; Akita, Yasukazu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The fixation (oxidation) of atmospheric tritium gas (HT) in vegetation in in vitro experiments was determined for pine needles, pine bark, lichen attached to pine trees, taken from a coastal pine forest, and compared with that in soil. HT oxidation in pine needles was extremely low and about 1/40000 that in the surface soil, whereas its oxidation in pine bark with a lichen was almost 1000-7000 times that in pine needles. In vivo laboratory experiments on HT fixation in pine trees were conducted using one-way circuit inhalation apparatus and potted dwarf pine trees. After 2 hours of exposure to HT, tritium distribution and its specific activity in pine needles, branches, trunk, roots and soil were measured. Tritium distribution in the pine needles was 0.30% that in the soil. However, HT oxidation in the pine needles was only about 0.003% that in the soil. (author).

53506 (IPPJ-REV–3, pp. 107-111) **Comparison of oxidation activity of tritium gas among various animals and man. Analysis of intestinal bacterial flora for oxidation.** Ichimasa, Michiko (Ibaraki Univ., Mito (Japan). Faculty of Science); Ichimasa, Yusuke; Hashimoto, Noriko; Oda, Minoru; Akita, Yasukazu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The oxidation of tritium gas (HT) by fecal suspensions from rat, monkey and man was measured under aerobic and anaerobic

conditions. In any case tested, the HT oxidation activity in fecal suspension under anaerobic conditions was almost the same among animals and man and remarkably higher than that under aerobic conditions. In oder to understand what kinds of bacteria actually oxidize HT in the intestine, a number of bacterial strains were isolated from rat and human feces by using various media for isolation and selection of intestinal anaerobes. Among the isolates, 27 strains derived from rat feces and 63 strains from human feces were found to oxidize HT under anaerobic conditions. Most of them were identified as some species of Bacteroides, Fusobacterium, Veillonella or Clostridium, and some of them were facultative anaerobes and identified as Escherichia coli. HT oxidation activity of Veillonella was highest. All strains identified as Lactobacillus acidphilus, L. plantarm of Bifidobacterium adlescentis did not oxidize HT. (author).

53507 (IPPJ-REV–3, pp. 112-117) **Can oxidation of tritium gas in intestine be suppressed by a drug in rats?.** Ichimasa, Yusuke (Ibaraki Univ., Mito (Japan). Faculty of Science); Shiba, Hajime; Ichimasa, Michiko; Chikuuti, Masaaki; Akita, Yasukazu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Clindamycin is known as an antibiotic effective against intestinal anaerobes. Administration of norfloxacin or clindamycin to rats began 1, 2, 3 or 4 days before commencement of exposure to tritium gas respectively and kept up until the day before exposure to tritium gas. After exposure to tritium gas for 2 hours, rats were sacrificed and tritium activity of various tissues and blood were determined. Tritium concentration in blood decreased in proportion to the period of administration of a drug. In the case of norfloxacin, tritium concentration in rat body decreased 1/5 that in non-treated rats. On the other hand, when administration of clindamycin began the day of exposure and kept up for 4 days, the biological half life of administrated rats was shortened to 3/5 that of non-treated rats.

53508 (IPPJ-REV–3, pp. 118-122) **How far intensitive instillation will get rid of tritium from body of rats?.** Ichimasa, Yusuke (Ibaraki Univ., Mito (Japan). Faculty of Science); Abe, Miyuki; Fukusima, Yuuko; Kitamura, Masami; Chikuuti, Masaaki; Akita, Yasukazu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Following a single administration of tritiated water (HTO) by injection, rats daily received instillation of one of the following fluids, Ringer's solution, 10% glucose, low molecular dextran or KN2B fluid maintenance, through into a tail vein. In some experiments, a diuretic, sodium acetazolamide, was also administerd by daily intramuscular injection in combination with instillation. After 8 days treatment, rats were sacrificed and total and tissue bound tritium activities in various tissues and blood were determined. All fluids tested were found to enhance successfully the excretion of the incorporated tritium. Especially, joint administration of Ringer's solution and sodium acetazolamide facilitated the decrease of tritium activity in urine most effectively. The biological half-life in joint administrated rats was shortened to 1.2 days in contrast to 3.0 days in control rats and total tritium activity of various tissues decreased to about one tenth that of tissues in control rats. These enhancing effects of instillation treatments were observed in prolonged treatment up to 75 days. (author).

53509 (IPPJ-REV–3, pp. 123-128) **Tritium absorption through various types of trauma in the skin of hairless mice and its prevention.** Sawada, Shozo (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). The rate of absorption of tritium through traumatized skin was assessed by studying its absorption in an animal model. Using female hairless mice(SKH/hr-1), incision, abrasion, thermal burn, and chemical burn caused by HCl were artificially inflicted on the skin of the back of the mice. One drop of tritiated water (HTO) was placed on the traumatized skin and the radio-activity was measured in small blood samples every 10 minute. Although the nature of trauma was quite different from one another, the rate of absorption was 18 times faster for incisions, 12 times faster for abrasions, 10 times faster for thermal burns and 1.2 times faster for chemical burns. Similar experiments were performed using tritium vapor because HTO evaporated easily. It was noted that except with incisions, the rate of absorption of tritium vapor was similar to that of HTO in abrasions, thermal burns and chemical burns by HCl. In the case of incisions, the rate of absorption of tritium vapor was significantly slower than that of HTO. Changes in the absorption rate of HTO and tritium vapor during recovery from abrasions were also measured. It was observed that the rate decreased and attained that of normal skin absorption values 10 to 16 days. The inhibition of tritium absorption through abrasion was also studied. Nivea cream showed the most effective inhibition. (author).

53510 (IPPJ-REV–3, pp. 143-147) **Effect of tritiated water on human hemopoietic stem cells.** Shigeta, Chiharu (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology); Kamada, Nanao; Ohkita, Takeshi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Effects of tritiated water beta rays, 60 cobalt gamma rays and 252 californium neutrons on hemopoietic stem cells from human bone marrow were studied using in vitro cell culture techniques. The two kinds of progenitor cells in erythroid lineage, BFU-E and CFU-E, were more radiosensitive than those of stromal stem cells, CFU-F, to the three radiation sources. All the survival curves of the erythroid progenitor cells showed a linear shape, however, those of stromal stem cells irradiated with 60 cobalt had an initial shoulder. Therefore, by estimation based on data from CFU-F, RBEs of tritiated water and 252 californium was more than 3 under 1 Gy. (author).

53511 (IPPJ-REV–3, pp. 148-158) **Chromosomal damage in human spermatozoa caused by in vitro irradiation of tritium β-rays.** Kamiguchi, Yujiroh (Asahikawa Medical Coll., Hokkaido (Japan)); Tateno, Hiroyuki; Mikamo, Kazuya. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Effects of tritium (HTO) β-rays on human sperm chromosomes were studied using our interspecific in vitro fertilization system between human spermatozoa and zona-free hamster oocytes. Semen samples were treated with media containing 1.53 - 24.30 mCi/ml HTO for about 80 minutes. Six hundred and forty-six spermatozoa were karyotyped in the controls and 1,383 spermatozoa in the irradiated groups. The incidence of spermatozoa with structural chromosome aberrations increased linearly with increasing dosage. Breakage type aberrations occurred far more frequently than the exchange type. Chromosome type aberrations appeared far more frequently than the chromatid type. All of these types of aberrations showed linear dose-dependent increases. The RBE values of HTO β-rays relative to X-rays were calculated for the above-mentioned 5 indices, respectively. Their RBE values ranged from 1.91 to 3.18 when the absorbed dose was estimated to be the minimum, whereas the values ranged between 1.05 and 1.75 when the absorbed dose was estimated to be the maximum. (author).

53512 (IPPJ-REV-3, pp. 159-163) **RBE of tritium beta-rays for cell killing of normal human cells in vitro.** Nakamura, Nori (Radiation Effects Research Foundation, Hiroshima (Japan)). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

RBE of tritium beta-rays for cell killing was obtained for three types of human cells. Cells were treated either by tritiated water or by 60-Co gamma-rays for up to 2 hours at 37degC and resulting dose-survival curves were fitted by a linear quadratic equation. The ratios of the dose-linear terms gave maximum RBE of 1.4 for skin fibroblasts, 2.3 for thyroid epithelial cells and 2.8 for peripheral T lymphocytes. (author).

53513 (IPPJ-REV-3, pp. 164-169) **Single-strand breaks in DNA and transformation inactivation induced by tritiated water.** Takakura, Kaoru (International Christian Univ., Mitaka, Tokyo (Japan)). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The induction of single-strand breaks in DNA by tritiated water in aqueous solution was studied by agarose gel electrophoresis. Also the transformation inactivation of the DNA was studied with ampicillin resistance as a marker when the DNA transfer E.coli cells (HB101). Plasmid DNA, pBR322, in SSC buffered solution was kept with tritiated water of different concentrations ranging 5.88 x 10^{-2} Gy/h - 1.18 x 10^{-4} Gy/h at 4degC, that is, the DNA was irradiated at several different dose rates. Accumulated hydrogen peroxide in tritiated water was removed by catalase treatment just before adding tritiated water to DNA solution. After the irradiation with tritiated water DNA was rinsed by isotope-free SSC buffer to eliminate the radioactivity using ultra filtration filter, than the DNA was used to analyse its single-strand breaks and transformation inactivation. As the result it was observed that the efficiencies of single-strand breaks and transformation inactivation increased as decreasing dose rate. The values of relative biological effectiveness (RBE) were obtained to be about 0.3 - 0.4 for single-strand breaks and about 1 for transformation inactivation using the result from the irradiation with Co-60 gamma-rays at the similar low dose rate. (author).

53514 (IPPJ-REV-3, pp. 170-172) **Intracellular damage of DNA induced by tritiated water and its restoration.** Sakai, Kazuo (Tokyo Univ. (Japan). Faculty of Medicine); Nakamura, Nori; Suzuki, Norio; Okada, Shigefumi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Induction and repair of DNA breaks were studied in mouse L5178Y cells after exposure to tritiated water (HTO) or X-rays. The amount of DNA breaks immediately after HTO-treatment was linearly increased to the dose and was smaller than the initial breaks by X-rays; RBE was 0.6. Repair profiles of DNA breaks revealed that HTO-induced breaks contained a larger proportion of slow/non-reparable components. The dose response curves of non-reparable breaks, which were determined 10hr after HTO-treatment of X-irradiation, were curvilinear and overlapped each other. These results indicate that RBEs of HTO previously reported for cell killing (1.0) and mutagenesis (1.2-1.3) were correlated with the amount of remaining breaks but not by the initial breaks. (author).

53515 (IPPJ-REV-3, pp. 173-179) **RBE of tritium beta radiation to gamma radiation and X-rays analyzed by both molecular and genetic methods.** Lee, W.R. (Louisiana State Univ., Baton Rouge (USA). Dept. of Zoology and Physiology). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The relative biological effectiveness (RBE) of tritium beta radiation to ^{60}Co gamma radiation was determined using sex-linked recessive lethals (SLRL) induced in Drosophila melanogaster spermatozoa as the biological effect. The SLRS test, a measure of mutations induced in germ cells and transmitted through successive generations, yields a linear dose-response curve in the range used in these experiments. From these ratios of the slopes of the ^{3}H beta and the ^{60}Co gamma radiation linear dose response curves, an RBE of 2.7 is observed. When sources of error are considered, this observation suggests that the tritium beta particle is 2.7 +- 0.3 times more effective per unit of energy absorbed in inducing gene mutations transmitted to successive generation than ^{60}Co gamma radiation. Ion tracks with a high density of ions (high LET) are more efficient than tracks with a low ion density (low LET) in inducing transmissible mutations, suggesting interaction among products of ionization. Molecular analysis of X-ray induced mutations shows that most mutations are deletions ranging from a few base pairs as determined from sequence data to multi locus deletions as determined from complementation tests and Southern blots. (author).

53516 (IPPJ-REV-3, pp. 180-188) **Adaptive response of human lymphocytes to very low doses of radiation from tritiated thymidine or X rays. A case of induced repair.** Wolff, S. (California Univ., San Francisco (USA). Lab. of Radiobiology and Environmental Health). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

When human lymphocytes are cultured with [^{3}H] thymidine under conditions whereby only one disintegration of tritium occurs, or are exposed to very low doses of X rays (0.5 - 1.0 cGy) of 250 kVp X rays, the cells become adapted to radiation in that they become refractory to subsequent exposures to high doses of X rays or exposures to many chemical agents. That is, cells pre-exposed to low doses of [^{3}H] thymidine or of X rays that in themselves do not induce a sensible number of chromatid breaks have up to one-half as many breaks induced by higher doses. This response can also be induced by agents that produce double-strand breaks in DNA, such as H_2O_2 or the radiomimetic agent, bleomycin, and can be inhibited by 3-aminobenzamide (3-AB), an inhibitor of poly (ADP-ribose) polymerase induced in response to the production of strand breaks in DNA, and also inhibited by the protein synthesis inhibitor, cyclohexamide. These data are interpreted as indicating that the adaptation is caused by the induction of a hitherto unknown repair mechanism that if in place at the time of the exposure to high doses, will result in less of the initial damage being converted to frank chromosomal breaks, i.e., will result in less cytogenetic damage. Two-dimensional gel electrophoresis experiments carried out on the proteins found in lymphocytes exposed to 1 cGy of X rays have shown that these low doses indeed do reproducibly induce specific proteins that are not present in unirradiated lymphocytes. These new proteins are considered to be good candidates for being the induced repair enzymes. (author).

53517 (IPPJ-REV-3, pp. 189-199) **Novel chromosomal response to low-level tritium. Adaptive response induced by ionizing radiation in cultured Chinese hamster cells.** Ikushima, Takaji (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190-: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Pre-treatment with low doses of β-rays from incorporated tritiated thymidine (^{3}H-dThd) or of Co-60 γ-rays (1 or 5 cGy) rendered actively growing Chinese hamster V79 cells more resistant to the induction of micronuclei or sister chromatid exchanges (SCEs) by a subsequent high dose of γ-rays (1 Gy). This adaptive response to ionizing radiation can be induced by an optimal range of low doses of ^{3}H β-rays, but not by much lower or higher adapting doses. The induced resistance was abolished after the ^{3}H-adapted cells had divided once or when 3-aminobenzamide (3AB) was given before the challenging doses, which suggests a short life for the adaptive response and the involvement of poly (ADP-ribose) polymerase in this response. The ^{3}H-adapted cells were somewhat resistant to SCE-induction but not to micronucleus-induction by challenge doses of high LET radiation from the reactor, KUR. Full expression of the adaptive response induced by the exposure to low doses of ^{60}Co γ-rays occurred 4 h after the adapting dose. The cells pre-exposed to low doses of γ-rays showed cross-resistance to challenge doses of γ-rays, itself and also of mitomycin C (MMC) and near ultraviolet light (UV-B, 313 nm), but not to those of ethyl methanesulfonate (EMS) or cisplatinum (II) diammine dichloride (cisplatin) for SCE induction. These results suggest that the adaptive response to ionizing radiation is different from that to alkylating agents, and that it may be mediated through a hitherto unknown inducible DNA-repair network. (author).

53518 (IPPJ-REV–3, pp. 137-142) **Development of a monitoring system for human exposure to tritium. Chromosome aberrations in human lymphocytes exposed to HTO.** Morimoto, Kanehisa (Osaka Univ. (Japan). Faculty of Medicine); Ogawa, Yasutaka; Okayama, Akira; Shirakawa, Taro; Miura, Kunihiko. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Human lymphocytes at G_0 were exposed in vitro to HTO to obtain the dose-response relationship between exposure and the dicentric and ring (D+R) frequency, to see the dose-rate effect on the chromosome aberration frequency, to calculate mean value of relative biological effectiveness (RBE) at the dose-range examined, to investigate the enhancing effect of the combined treatment with metabolic inhibitors on the HTO-induced chromosome aberrations, and to evaluate the influences of the life-styles of the blood donors on the enhancement of HTO-induced chromosome aberration frequencies by a metabolic inhibitor cytosine arabinoside (ara-C). The dose-response curve obtained was shown to be fitted by a power model: Y = 0.205 $X^{1.29}$, or a linear quadratic model: Y = 1.5center dot10^{-3} X + 1.9center dot10^{-6} X^2, where X is HTO exposure in cGy and Y is the D+R frequency. When lymphocytes were exposed to HTO at 3 different dose rates, it was found that exposure at 0.042 Gy/h produced a 30% smaller number of D+R chromosomes than exposure at 0.5 Gy/h. Mean RBE value was estimated to be 1.49 +- 0.21 within the dose range examined. In cultures exposed to 2-Gy HTO β-rays along with various metabolic inhibitors, a remarkably enhanced ratio of D+R frequencies was observed when cells were combinedly exposed to ara-C, varying from 2 to 5 among lymphocytes from different blood donors. Caffeine, fluorodeoxyuridine (FUdR) or 3-aminobenzamide (3-AB) also enhanced HTO-induced chromosome aberrations by 20-50% whereas hydroxyurea (HU) and cycloheximide (CHX) appear not to affect the HTO-induced D+R frequency. With blood donors who excessively smoked cigarettes, consumed alcohol beverages, or were mentally stressed, etc., there appeared to be a significant influence on the ara-C enhancement effect.

53519 (IPPJ-REV–3, pp. 200-210) **Cell killing and mutation to 6-thioguanine resistance after exposure to tritiated amino acids and tritiated thymidine in cultured mammalian cells.** Ueno, A.M. (National Inst. of Radiological Sciences, Chiba (Japan)); Furuno-Fukushi, Ikuko; Matsudaira, Hiromichi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Cell killing and mutation to 6-thioguanine resistance were studied in growing mouse leukemia cells (L5178Y) in culture after exposure to tritiated amino acids and tritiated thymidine, and compared to those following HTO and γ ray exposure. These effects varied widely among the tritiated compounds tested, being greatest for tritiated thymidine followed by tritiated arginine and tritiated lysine, tritiated leucine, in that order, for a given concentration of tritium expressed in kBq/ml of tritium in the medium. A difference of 3 order of magnitude was found between tritiated thymidine and HTO. The differences between each tritiated amino acid and those between tritiated amino acids and HTO disappeared almost totally when the effects were compared on the basis of the absorbed dose to the cell. The effects of tritiated thymidine, however, remained more than two-fold greater compared to other tritiated compounds including HTO. The results indicate the importance of determining the absorbed dose for assesment of the radiotoxicity of tritiated compounds. For an exceptional case (tritiated thymidine), contribution of a mechanisms(s) other than β irradiation should also be taken into account. Similar studies are being carried out in contact inhibited near-diploid mouse embryonic skin cells (m5S), kindly provided by Dr. M. S. Sasaki. For cell killing, results essentially similar to those found in the L5178Y cells were obtained for tritiated compounds tested: tritiated leucine, tritiated arginine and tritiated lysine. (author).

53520 (IPPJ-REV–3, pp. 211-216) **Neoplastic transformation and chromosome aberration induced by tritiated water in golden hamster embryo cells.** Suzuki, Fumio (Kanazawa Univ. (Japan). Faculty of Pharmaceutical Sciences); Mori, Toshio; Nikaido, Osamu; Suzuki, Keiji; Watanabe, Masami. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Using cultured golden hamster embryo (GHE) cells, we examined the induction of cell killing, neoplastic transformation and chromosome aberration by exposure to tritiated water (HTO) and compared its biological effectiveness with those of X- or ^{60}Co γ-rays and fission neutrons from ^{252}Cf. X- and γ-rays showed similar dose-response curves for cell survival and transformation. The cells irradiated with these radiations in ice-cold condition were much more sensitive for the induction of cell killing and transformation than those exposed at 37degC. A similar temperature dependency was observed with HTO treatment, although the effect of HTO was higher for cell killing but lower for transformation than those of X- and γ-rays. On the other hand, fission neutrons were much more effective for the induction of both the cell killing and transformation in either warm or cold condition. The cells treated with HTO produced more chromosome aberrations that those exposed to X-rays. In the cells survived after exposure, however, X-irradiated cells showed higher frequency of trisomy and monosomy than HTO treated cells. From these data, we conclude that the biological reaction of β-rays from HTO is not similar to those of X- or γ-rays and neutrons. (author).

53521 (IPPJ-REV–3, pp. 217-222) **Cell death induced in mouse intestine by tritiated water, tritiated thymidine and gamma rays.** Ijiri, Ken-ichi (Tokyo Univ. (Japan). Radioisotope Center). Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Cell death induced by continuous irradiation with gamma rays (externally given by a Cs-137 source) or with beta rays from tritiated water (HTO) injected ip was quantified in the crypts of two portions of mouse bowel, i.e., small intestine (SI) and descending colon (DC). The time-course changes in the incidence of cell death after

each type of radiation were studied. For 6-h continuous gamma irradiation with various dose-rates (0.6 - 480 mGy/h) and for 6 h after HTO injection of various radioactivities (0.15 - 150 GBq per kg body weight), relationships between dose-rate and incidence of cell death were obtained and survival curves were constructed. For the calculation of the absorbed dose from HTO, water content of the cells was assumed to be 70 %. The mean lethal dose-rate i.e., the dose-rate which reduced survival to 37 % was calculated for gamma rays and HTO, and RBE of HTO was obtained. The RBE of HTO relative to gamma rays for cell killing in both SI and DC of mouse intestine lies around 1.4-1.6. Tritiated thymidine (^{3}HTdR) was also injected to mice, and its effects on cell killing were studied. (author).

53522 (IPPJ-REV–3, pp. 223-228) **Carcinogenic effect of tritiated water (HTO) in mice in comparison with those of fission neutrons and gamma-rays.** Yokoro, Kenjiro (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology); Yamamoto, Osamu; Seyama, Toshio; Nitta, Yumiko; Niwa, Ohtsura. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Carcinogenic effect of radiations with different quality was assessed in female (C57BL/6N x C3H/He)F_1 mice given either 2.7 Gy of fission neutrons from a ^{252}Cf source or ^{60}Co gamma-rays, or a single i.p. injection (2.8×10^8, equivalent to 2.7 Gy) of HTO. A prominent carcinogenic effect of fission neutrons was shown; tumors were developed with a shorter latency, higher frequency, wider spectrum of the target tissue and higher tumor multiplicity in individual animals as compared with those of HTO beta-rays or ^{60}Co gamma-rays. The RBE in carcinogenicity of HTO doesn't exceed much gamma-rays in the dose range employed in the present study. (author).

53523 (IPPJ-REV–3, pp. 230-233) **In vivo somatic mutation in mice induced by tritiated water.** Nomua, Taisei (Osaka Univ. (Japan). Faculty of Medicine); Yamamoto, Osamu. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

To estimate genetic risk of tritiated water to humans, we examined dose-response relationship of mutation in the whole body with the use of very sensitive in vivo method to detect somatic mutation in mice. PT females (a/a, b/b, pc^{ch}, pc^{ch} d/d) were mated with HT males (a/a, pa/pa, In/In, pe/pe), and then F_1 embryos from PT x HT cross, heterozygous at 7 recessive coat color genes, were treated with a single i.p. injection of 4.4, 2.2, and 0.7 MBq of tritiated water per g of body weight at 14:00 on the 10th of gestation. Somatic mutation was detected as a colored spot on the non-agouti (black) background 4 weeks after birth. Frequency of vivo somatic mutations induced by tritiated water increased almost linearly with doses of tritiated water; 22/750 (0.03), 13/133 (0.10), 12/92 (0.13), and 22/85 (0.26) at 0, 0.7, 2.2, and 4.4 MBq/g, respectively. Cummulative doses of tritium for 4 days from the 10th to 14th day of gestation, were approximately 70 % of the total (30 rad as absorbed dose). Mutation rate per locus per μCi/g was calculated to be 1.8×10^{-7}. On the assumption that dose-response curve by the reference radiation (chronic X-ray exposure) is linear at 30 rad, RBE of tritiated water was estimated to be about 2.7 at present. These values are similar to those for spermatogonial mutation. (author).

53524 (IPPJ-REV–3, pp. 234-238) **Dose-rate dependency of radiation-induced germ cell mutation. Development of a new mutation assay system using the fish, Medaka Oryzias latipes.** Shimada, Atsuko (Tokyo Univ. (Japan). Faculty of Science); Shima, Akihiro. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

A new specific-locus mutation assay system using the fish Oryzias latipes has been developed. An advantage of our system is that we can detect deaths around hatching period of many mutant embryos whose mutant phenotypes could be recognized, as 'total mutations', early after fertilization. This system has revealed that 80 to 90 % of the embryos with total mutations induced in spermatogonia by gamma-rays died of some developmental defects before hatching. We are studying dose-rate dependency of total mutations as well as viable mutations induced in spermatogonia. Although our data are still incomplete, it is indicated that no dose-rate effect was found in total mutations, whereas dose-rate effect exists with regard to viable mutations under the present experimental conditions. (author).

53525 (IPPJ-REV–3, pp. 251-263) **Effect of tritiated water on germ cells and fertility. A comparative study with tritium simulation using oocyte death of mouse newborns as index.** Satow, Yukio (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology); Hori, Hiroshi; Ohtaki, Megu; Nakamura, Nori. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The relative biological effectiveness (RBE) of tritiated water (HTO) was sought by comparison with the results of tritium simulation using Cs-137 and the results obtained by irradiating with Co-60 gamma rays and fission neutrons (Cf-252) for reference, using as index the lethal effect on mouse newborn oocytes. The method was to inject various doses of HTO once into the abdominal cavity of ICR mouse on the 14th day after birth and the survival rate of oocytes were calculated. As a result, the number of surviving oocytes decreased exponentially depending on the dose of HTO or Cs-137, and 1.1-3.5 was given as the RBE. Further, the resutls of the tests with Co-60 and Cf-252 that were made for reference showed the lethal effect on oocytes to be stronger in the order of Cf-252, HTO, Co-60 and Cs-137. The effects of HTO and Cs-137 on the reproductive capacity (RC) were also studied raising the female mice which were exposed to HTO or Cs-137 as same procedure. The mice were delivered of litters four times in two years. The HTO or Cs-137 induced diminution of RC may be dose dependent and seems to be non-stochastic. (author).

53526 (IPPJ-REV–3, pp. 264-273) **Radiolethal and genetic vulnerabilities of germ cells in the female mammal. Effects of tritium and other radiations compared.** Straume, T. (Lawrence Livermore National Lab., CA (USA)); Kwan, T.C.; Dobson, R.L.; Goldstein, L.S. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

We have shown that the lethality target in mouse immature oocytes is non-nuclear; it is equal in cross-sectional area to the entire oocyte and is separated from the nucleus by about 4μ. A substantial body of data now points to the plasma membrace as the lethality target in these particular cells. These new insights have led to novel experimental designs using low-energy neutrons (certain other radiations should also be usable) to identify and measure radiation-induced genetic effects in immature oocytes of the mouse. These important effects have escaped detection heretofore. We have quantified both chromosome aberrations and dominant lethal mutations in oocytes from females exposed 8 to 12 weeks earlier. Results from these and other studies show that: (1) for immature oocyte killing in mice, chronically administered ^{3}HOH is of near maximum biological effectiveness, similar to the most effective neutrons and heavy ions (likely true also for female germ-cell killing in some prenatal primates), (2) tritium incorporated into DNA as ^{3}H-Tdr is about 100 times less effective in mouse immature oocyte

killing than is tritium administered as ^3HOH, and (3) for mutagenicity in the mouse, immature oocytes appear to have approximately the same sensitivity as mature oocytes (contrary to previous claims) and show dose and LET responses similar to those obtained from genetic studies of other cells. The possible implications of these findings for women exposed to tritium are considered. (author).

53527 (IPPJ-REV–3, pp. 274-279) **Effect of organically bound tritium (OBT) on pre-implantation mouse embryos in vitro.** Yamada, Takeshi (National Inst. of Radiological Sciences, Chiba (Japan)); Ohyama, Harumi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

Effect of organically bound tritium (OBT), such as tritiated thymidine and tritium-labeled amino acids, on mouse preimplantation embryos was examined in vitro. Mouse zygotes fertilized in vitro ($BC3F_1$ eggs x ICR sperm) were cultured in the media containing OBT in various concentrations up to the blastocyst stage. The LD_{50} in terms of tritium concentrations in the culture medium were determined by measuring tritium concentrations in the medium to inhibit 50 % of embryos to form blastocyst in vitro. Tritium activities in the embryos were measured at various times during culture of embryos at LD_{50} concentration in order to estimate absorbed radiation dose in embryonic cells. The LD_{50} values obtained indicate that OBT could inhibit the embryonic development 1000 times more effectively that tritiated water (HTO). However, differences in LD_{50} values in terms of absorbed radiation dose between OBT and HTO is not so essential, and might be explained by localized spatial distribution of OBT within the cell. (author).

53528 (IPPJ-REV–3, pp. 280-286) **Teratogenic effect of tritium water and tritium simulator on rat embryos.** Satow, Yukio (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology); Lee, Juing-Yi; Sawada, Shozo. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

The teratogenic effects of tritium water (HTO) on rat embryos were examined and the results obtained were compared with those of tritium simulator (Cs-137 gamma-rays) for determining the relative biological effects (RBE) for the incidence of malformations. Six groups of pregnant rats were injected interaperitoneally with HTO containing 25, 50, 75, 100, 125 or 150 mCi HTO/300g B.W. on day 7, 8, 9, 10 or 11 of pregnancy. To obtain accurate RBE values of HTO in rats, five groups of pregnant rats were exposed to Cs-137 gamma-rays by tritium simulator on days 9-18 of pregnancy at exponentially decreasing doses in accordance with body tritium concentration. The rats were sacrificed on day 18 and the offsprings were examined for external and internal malformations. Malformations were seen at the highest incidence of 100 % of the survived embryos and 81.3 % of total implants in the group given 100 mCi (accumulated doses were about 451 rad) of HTO on day 9 of pregnancy. Tritium simulator accumulated doses of Cs-137 gamma-rays irradiation at 680 rad induced 98.4 % malformation in survived embryos and 71.7 % of the total implatns on day 9 of pregnancy. Both radiations (HTO and Cs-137 gamma-rays) induced similar anomalies of the cardiovascular system in rat embryos. In the present study, comparisons between HTO and tritium simulator showed the teratogenic effectof RBE to be greater than 1.8 and to reach approximately 2.6. The results showed that HTO had stronger teratogenic effects as compared with those of Cs-137 gamma-rays. (author).

53529 (IPPJ-REV–3, pp. 287-292) **Tritium metabolism in animals and estimation of the accumulated dose.** Saito, Masahiro (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.); Ishida, M.R. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

This paper describes the recent advances in our laboratory in the development of the metabolic model of tritium retention for the animal body and the estimation of the dose modification factor for the organically bound tritium (OBT). Tritium retention data have been accumulated for the mice used as a model animal. These data stimulated us to propose a modified three compartment model in which the organically bound tritium (OBT) is directly taken in by a OBT compartment. This model predicts the specific activity ratio in tissue (SAR) as a function of the ratio of OBT intake compared to the intake of the free water tritium (FWT) in the daily diet at equilibrated condition. In a parallel work, the dose modification factor (DMF) for the OBT was estimated for the DNA bound tritium and the protein-bound tritium. The DMF for the DNA-bound tritium and that for the protein-bound tritium were between 2 and 6 and between 0.8 and 1.5, respectively varying among various organs. (author).

53530 (KURRI-TR–316, pp. 37-42) **Tritium concentrations in tree ring cellulose.** Kaji, Toshio (Kyushu Univ., Fukuoka (Japan). Radioisotope Center); Momoshima, Noriyuki; Takashima, Yoshimasa. Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1989. (In Japanese). (CONF-8811269–: Intensive seminar on 'tree rings', Kumatori (Japan), 29-30 Nov 1988). In *Papers presented at the intensive seminar on 'tree rings'.* Order Number DE90705931. Available from NTIS (US Sales Only), PC A05/MF A01.

Measurements of tritium (tissue bound tritium; TBT) concentration in tree rings are presented and discussed. Such measurement is expected to provide a useful means of estimating the tritium level in the environment in the past. The concentration of tritium bound in the tissue (TBT) in a tree ring considered to reflect the environmental tritium level in the area at the time of the formation of the ring, while the concentration of tritium in the free water in the tissue represents the current environmental tritium level. First, tritium concentration in tree ring cellulose sampled from a cedar tree grown in a typical environment in Fukuoka Prefecture is compared with the tritium concentration in precipitation in Tokyo. Results show that the year-to-year variations in the tritium concentration in the tree rings agree well with those in precipitation. The maximum concentration, which occurred in 1963, is attibuted to atmospheric nuclear testing which was performed frequently during the 1961 - 1963 period. Measurement is also made of the tritium concentration in tree ring cellulose sampled from a pine tree grown near the Isotope Center of Kyushu University (Fukuoka). Results indicate that the background level is higher probably due to the release of tritium from the facilities around the pine tree. Thus, measurement of tritium in tree ring cellulose clearly shows the year-to-year variation in the tritium concentration in the atmosphere. (N.K.).

53531 (NIRS-R–16) **Final report on the project research 'stochastic effects of irradiation and risk estimation'. April 1983 - March 1988.** National Inst. of Radiological Sciences, Chiba (Japan). Mar 1989. 167p. (In Japanese). Order Number DE90710149. Available from NTIS (US Sales Only), PC A08/MF A01.

The title project research was carried out through 1983-1987, by three groups for the studies of radiation carcinogenesis, human genetic effects, and radiotoxicology. 8 reports by the first group, 3 by the second, and 6 by the third group are collected in this issue. The contents are as follows. Serial sacrifice study on tumorigenesis in male C57BL/6J mice exposed to gamma-ray or fast neutron radiation; Influence of biological variables on radiation carcinogenesis; Studies on radiation-induced thymic lymphomagenesis; Modifying factors of radiation induced myeloid leukemia of C3H/He mouse; Cell kinetic studies on radiation induced leukemogenesis; Cytogenetical studies on the mechanism of radiation induced neoplasmas; Molecular biological study on genetic stability of the genome; Protein factors regulating proliferation and differentiation of normal and neoplastic cells; Studies on dose-radiation relationships for induction of chromosome abberations in stem-spermatogonia of three crab-eating monkey after low and high dose rate γ-irradiation; Risk estimation of radiation mutagenesis in man by using cultured mammalian cells; Effects of ionizing radiation on male germ cells of

crabeating monkey; Movement and metabolism of radioactive particles in the respiratory tract; Studies on dosimetry for internally deposited alpha-emitters; Comparative toxicological studies on the effects of internal exposures; Studies on treatment of alpha-radioactive wastes; Methodological studies on the inhalation of radioactive aerosols; Removal of transuranic elements by DTPA. (A. Y.).

53532 (ORNL/FTR–2459) **[Radiation protection]: Foreign trip report, November 8, 1986–November 21, 1986.** Fry, R.J.M. Oak Ridge National Lab., TN (USA). 5 Dec 1986. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017306. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

I undertook this trip to attend the International Committee on Radiation Protection (ICRP) Committee 1 meeting held in Jerusalem. The items on the agenda were a number of reports on the following: (1) radiation effects on the developing brain, (2) RBEs for nonstochastic effects, (3) hereditary effects, (4) RBE for Auger electrons, (5) hormesis, (6) risk coefficient for radiation-induction of bladder cancer, (7) probability of causation of cancer, (8) biological basis for dose limitation to the skin, and (9) responses to questions relating to ICRP 26. On November 20, I visited Dr. S. B. Field at the MRC Cyclotron Unit at Hammersmith to discuss their new directions in research and to discuss journal editorships.

53533 (ORNL/FTR–2637) **[Induction and repair of uv damage]: Foreign trip report, July 18, 1987–July 27, 1987.** Regan, J.D. Oak Ridge National Lab., TN (USA). 7 Aug 1987. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017348. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended the 8th International Congress on Radiation Research and presented a paper entitled "Xeroderma pigmentosum variant cells do not remove a uv-induced photosensitive lesion from their DNA." Approximately 1400 scientists participated in the Congress. There were five days of presentations with usually six simultaneous sessions taking place. The traveler was particularly impressed with the numerous presentations on irradiation of small molecules. There were many papers on different aspects of DNA repair. The presentations and the traveler's discussions with scientists at the Congress will be beneficial to the traveler's research program at ORNL.

53534 (ORNL/FTR–2840) **[Radiation susceptibility]: Foreign trip report, March 15–23, 1988.** Preston, R.J. Oak Ridge National Lab., TN (USA). 7 Apr 1988. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017302. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler was a participant in a workshop at RERF that was established to determine if current data or future studies could be utilized to address the question of whether radiation-sensitive individuals could have been over-represented in the A-bomb non-survivors in Hiroshima and Nagasaki and thereby affect the cancer incidences. The topic was addressed by presentations by RERF staff on their current studies pertinent to radiation susceptibility; round-table discussions among panel members and observers; a written series of recommendations prepared by the workshop members and presented to the RERF council.

53535 (ORNL/FTR–3383) **[Radiochemical limnology]: Foreign trip report, August 12–September 16, 1989.** Olsen, C.R. Oak Ridge National Lab., TN (USA). 27 Sep 1989. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001253. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The 24th Congress of the International Association of Theoretical and Applied Limnology (SIL) was organized to provide an opportunity for about 2000 scientists representing more than 50 countries to present and discuss their research results on theoretical and applied limnology. The traveler was a co-organizer and co-chair of a special workshop/symposium at this meeting entitled "Radiochemical Limnology."

53536 (PNL–6889-HEDR) **Feasibility of using ^{129}I concentrations in human tissue to estimate radiation dose from ^{131}I: Hanford Environmental Dose Reconstruction Project.** McCormack, W.D. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE90000919. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To use data on ^{129}I in human tissue to estimate an individual's past exposure to that radionuclide, it is necessary to know when and how the exposure occurred, and to know about any other prior and/or ongoing exposures. Moreover, to use ^{129}I data to estimate past exposure to ^{131}I, it is also necessary to know the relationship of the two radionuclides at the time of exposure. The relative quantities of ^{131}I and ^{129}I in gaseous effluents from Hanford Site facilities varied significantly because of the large variations in elapsed time between discharge of irradiated fuel from Hanford production reactors and initiation of chemical processing. The relationship of the two radionuclides also varied in the environment because the shorter-lived ^{131}I decayed and the longer-lived ^{129}I accumulated. Because of its extremely long half-life, ^{129}I from both Hanford and non-Hanford sources (such as fallout from weapons testing) has accumulated in the environment. Without an associated exposure to ^{131}I, chronic exposure to ^{129}I deposited in the environment has contributed and continues to contribute to thyroid burdens. Based on investigations conducted to date, measured levels of ^{129}I in human tissue will not provide a viable alternative for reconstruction of historical exposure to ^{131}I. 5 refs.

53537 (PNL–7135) **Offsite radiation doses from Hanford Operations for the years 1983 through 1987: A comparison of results calculated by two methods.** Soldat, J.K. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 26p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE90000983. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This report compares the results of the calculation of potential radiation doses to the public by two different environmental dosimetric systems for the years 1983 through 1987. Both systems project the environmental movement of radionuclides released with effluents from Hanford operations; their concentrations in air, water, and foods; the intake of radionuclides by ingestion and inhalation; and, finally, the potential radiation doses from radionuclides deposited in the body and from external sources. The first system, in use for the past decade at Hanford, calculates radiation doses in terms of 50-year cumulative dose equivalents to body organs and to the whole body, based on the methodology defined in ICRP Publication 2. This system uses a suite of three computer codes: PABLM, DACRIN, and KRONIC. In the new system, 50-year committed doses are calculated in accordance with the recommendations of the ICRP Publications 26 and 30, which were adopted by the US Department of Energy (DOE) in 1985. This new system calculates dose equivalent (DE) to individual organs and effective dose equivalent (EDE). The EDE is a risk-weighted DE that is designed to be an indicator of the potential health effects arising from the radiation dose. 16 refs., 1 fig., 38 tabs.

53538 (RERF-TR–1-89) **Whole-blood phagocytic and bactericidal activities of atomic bomb survivors, Hiroshima and Nagasaki.** Sasagawa, Sumiko; Yoshimoto, Yasuhiko; Toyota, Emiko; Neriishi, Shotaro; Yamakido, Michio; Matsuo, Miyo; Hosoda, Yutaka; Finch, S.C. Radiation Effects Research Foundation, Hiroshima (Japan). Apr 1989. 13p. Order Number DE90710065. Available from NTIS (US Sales Only), PC A03/MF A01.

This in vitro study evaluated the phagocytic and bactericidal activities of leukocytes in aliquots of whole blood from Hiroshima and Nagasaki atomic bomb survivors for Staphylococcus aureus. The data were analyzed by multiple linear regression. Any significant effects of exposure to A-bomb radiation could not be detected for both phagocytic and bactericidal activities of whole blood from A-bomb survivors. In addition, there were no significant effects of age categories, sex or city, except in neutrophil counts. (J.P.N.).

53539 (RERF-TR–7-88) **Comparison of the dose-response relationships for chromosome aberration frequencies between the T65D and DS86 dosimetries.** Preston, D.L.; McConney, M.E.; Awa, A.A.; Ohtaki, Kazuo; Itoh, Masahiro; Honda, Takeo. Radiation

Effects Research Foundation, Hiroshima (Japan). May 1989. 32p. (In Japanese, English). Order Number DE90710064. Available from NTIS (US Sales Only), PC A03/MF A01.

Cytogenetic data, derived from cultured lymphocytes of atomic bomb survivors and controls in the ABCC-RERF Adult Health Study cohort, have been analyzed to determine differences in the dose-response relationships for chromosome aberrations between the T65D and DS86 dose estimates and to assess differences between Hiroshima and Nagasaki. For a linear dose-response model, the average percentage of cells with at least one chromosome aberration increases less rapidly with dose in Nagasaki than in Hiroshima. The magnitude of the intercity difference in the percentage of cells with aberrations per gray is less for DS86 than for T65D, though the difference is statistically significant for both kerma and bone marrow dose with either dosimetry. The percentage of cells with aberrations per gray for DS86 kerma estimates is about 60 % greater than the corresponding T65D slope. Analyses to test nonlinearity in the dose-response function indicate significant departures ($p<.001$) from linearity, using both dosimetries for both kerma and marrow dose. Therefore, comparative results are presented for a range of RBE relationships under various linear (L) and linearquadratic linear (LQ-L) models. As an illustrative result, if one assumes an LQ-L model similar to models reported in the cytogenetic literature, with a limiting RBE of 20 at zero dose, the DS86 slope (the percentage of cells with aberrations per sievert) is 120 % greater than the corresponding T65D value. (J.P.N.).

53540 (WHC-SA-0527) **Contamination control: A balance between containment design and good practice in operation.** Sudmann, R.H. Westinghouse Hanford Co., Richland, WA (USA). Jun 1989. 12p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-87RL10930. (CONF-8909180–1: ANL conference on the prevention of significant safety-related events in the operation of US Department of Energy nuclear facilities, Richland, WA (USA), 11-14 Sep 1989). Order Number DE89016054. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

When working with plutonium, contamination control doesn't just happen. It must be designed into the facility and supported by operations with trained personnel and usable procedures. The concept of "total containment" tends to transfer the risk of contamination from the operator to the maintenance personnel. The risk of a contamination spread must be studied and contingencies planned for over the entire lifetime of the facility, including the decommissioning, which might be a decade or more in the future. Experience has shown that designs based solely on current operations may result in monumental problems during decommissioning. Good contamination control depends greatly on "the human factor" and therefore good operational management seems to be a larger factor for safety than the "total containment" of a glove box. Hanford operational experience indicates that gram quantities of plutonium may be safely handled in laboratory hoods when trained workers, good procedures, and workplace monitoring are in place. Experience indicates that personnel contamination events in gloveboxes mainly occur during cleanup or maintenance phases of the operation and not during routine production operations. Incidents involving glovebox operations have highlighted lessons learned. 8 refs.

53541 **Dose-response modeling of life shortening in a retrospective analysis of the combined data from the JANUS program at Argonne National Laboratory.** Carnes, B.A. (Argonne National Lab., IL (USA)); Grahn, D.; Thomson, J.F. *Radiation Research (USA)*, 119(1): 39-56 (Jul 1989).

Life shortening was investigated in both sexes of the B6CF1 (C57BL/6 x BALB/c) mouse exposed to fission neutrons and ^{60}Co gamma rays. Three basic exposure patterns for both neutrons and gamma rays were compared: single exposures, 24 equal once-weekly exposures, and 60 equal once-weekly exposures. Ten different dose-response models were fitted to the data for animals exposed to neutrons. The response variable used for all dose-response modeling was mean after-survival. A simple linear model adequately described the response to neutrons for females and males at doses less than or equal to 80 cGy. At higher neutron dose levels a linear-quadratic equation was required to describe the life-shortening response. An effect of exposure pattern was observed prior to the detection of curvature in the dose response for neutrons and emerged as a potentially significant factor at neutron doses in the range of 40-60 cGy. Augmentation of neutron injury with dose protraction was observed in both sexes and began at doses as low as 60 cGy. The life-shortening response for all animals exposed to gamma rays (22-1918 cGy) was linear and inversely dependent upon the protraction period (1 day, 24 weeks, 60 weeks). Depending on the exposure pattern used for the gamma-ray baseline, relative biological effectiveness (RBE) values ranged from 6 to 43. Augmentation, because it occurred only at higher levels of neutron exposure, had no influence on the estimation of RBEm.

53542 **Comparative metabolic behavior and interrelationships of Tc and S in soybean plants.** Cataldo, D.A. (Pacific Northwest Lab., Richland, WA (USA)); Garland, T.R.; Wildung, R.E.; Fellows, R.J. *Health Physics (USA)*, 57(2): 281-287 (Aug 1989).

The comparative behavior of sulfur (S) and technetium (Tc) in soybean seedlings shows gross subcellular distributions to be similar for these oxyanions. More than 75% of the tissue-deposited Tc remains soluble and extractable. Differences in Tc fixation/incorporation were noted for the nuclear and chloroplast fractions of leaf and root cells. Pulse studies showed that soluble protein and nitrate reductase levels rose in response to Tc accumulation by sink leaves but not source leaves. In vitro assay of chloroplast-based S reduction and incorporation systems showed Tc to be reduced and incorporated into amino nitrogen-containing products. A hypothesis related to the metabolic behavior of Tc in plants is presented.

53543 **Technetium-99 cycling in maple trees: Characterization of changes in chemical form.** Garten, C.T. Jr. (Oak Ridge National Lab., TN (USA)); Lomax, R.D. *Health Physics (USA)*, 57(2): 299-307 (Aug 1989).

Prior field studies near an old radioactive waste disposal site at Oak Ridge, TN, indicated that following root uptake, metabolism by deciduous trees rendered 99Tc less biogeochemically mobile than expected, based on chemistry of the pertechnetate (TcO-4) anion. Subsequently, the form of technetium (Tc) in maple tree (Acer sp.) sap, leaves, wood and forest leaf litter was characterized using one or more of the following methods: dialysis, physical fractionation, chemical extraction, gel permeation chromatography, enzymatic extraction, or thin layer chromatography (TLC) on silica gel. Chromatography (Sephadex G-25) of TcO-4 incubated in vitro with tree sap showed it to behave similar to TcO-4 anion. When labeled wood and leaf tissues were processed using a tissue homogenizer, 15% and 40%, respectively, of the Tc was solubilized into phosphate buffer. Most (65% to 80%) of the solubilized Tc passing a 0.45-micron filter also passed through an ultrafiltration membrane with a nominal molecular weight cutoff of 10,000 atomic mass units (amu). A majority (72% to 80%) of the Tc in wood could be chemically removed by successive extractions with ethanol, water and weak mineral acid. These same extractants removed only 23% to 31% of the Tc from maple leaves or forest floor leaf litter. Most of the Tc in leaves and leaf litter was removed only by strongly alkaline reagents typically used to release structural polysaccharides (hemicelluloses) from plant tissues. Chromatography (Sephadex G-25) of the ethanol-water extract from wood and the alkaline extract from leaves demonstrated that Tc in these extracts was not principally TcO-4 but was complexed with molecules greater than 1000 amu. Incubations of leaf and wood homogenates with protease approximately doubled the amount of Tc released from contaminated tissues.

53544 **Life, evolution, and the pursuit of single photon sensitivity.** Bitensky, M.W. (Los Alamos National Lab., NM (USA)); Whalen, M.M.; Torney, D.C. *Cold Spring Harbor Symposia on Quantitative Biology (USA)*, : 303-311 (1988).

Evolutionary forces have designed a large family of rod and cone photoreceptors, each member of which suits the lifestyle requirements and circadian patterns of a particular species. The three-segment architecture of signal transduction is conspicuous in the biochemistry of photoreceptors and supports their demonstrated properties of extreme sensitivity, low noise levels, extended dynamic range, and light adaptation. The designs elaborated by evolution reflect a gradual process of modification, with the sequential elaboration of layers of control and refinements in control. The end results of this long evolutionary labor are the functional efficiency and dynamic range that give the rod its utility. Our conceptual problems in deriving observed rod properties from the

collective features of known rod gene products may well give way when we have learned more about the true composition and topology of the outer segment gene set and both bound and free nucleotide concentrations. The invertebrates have developed alternative solutions to the problems of photoreceptor sensitivity and wide dynamic range. The vertebrate rod represents a truly optimized way to capture and interpret low-intensity photon signals. One may anticipate, with some enthusiasm, those molecular and kinetic data that will permit an understanding of how cones differ from rods and how release from the requirement for single photon detection has shaped the design of this wavelength-specific companion photoreceptor. The utilization by evolution of the three-segment architecture of GTP-dependent signal transduction for other modalities of sensory perception, such as olfaction and gustation is certainly a reasonable and successful choice. 56 references.

5603 Chemicals Metabolism and Toxicology

53545 (AD-A-209589/1/XAB) **Determination of the acute and repeated oral toxicity of halocarbon oil, series 27-S. Interim report, December 1986-November 1987.** Kinkead, E.R.; Culpepper, B.T.; Henry, S.S.; Szotak, P.S.; Flemming, C.D. Northrop Services, Inc./Environmental Sciences, Dayton, OH (USA). Feb 1989. 60p. Available from NTIS, PC A04/MF A01.

Halocarbon 27-S (HC 27-S), a polymer of chlorotrifluoroethylene (CTFE), is used as a lubricating oil for pumps in hyperbaric chambers. Although monomeric CTFE has been shown to produce renal lesions in rats, the toxicity of CTFE polymers has not been investigated. Following a single dose of 5 g HC 27-S, no signs of toxicity were noted and no lesions observed at sacrifice 14 days following treatment. To assess the toxicity of repeated exposure to HC 27-S, three groups (n=5) of male and female rats were dosed with 2.5 g HC 27-S/kg for 7 or 21 consecutive days. Groups were sacrificed at 7, 21, and 35 days after the initial dose. Decreased water consumption and urine output were apparent in all test groups. Significant increase in fluoride excretion was noted in 24-hr urine samples collected periodically during the study. The increased fluoride burden in treated animals appeared sufficient to alter bone calcium/phosphate ratios in male but not female rats. Increased liver and kidney weights were observed in all treated rats on all assessment days. Gross liver enlargement and hepatocellular cytomegaly indicated that the liver is probably the primary target organ following repeated administration of HC 27-S.

53546 (DOE/ER/60592–T2) **Particle deposition in human and canine tracheobronchial casts: Progress report.** New York Univ. Medical Center, Tuxedo, NY (USA). 1988. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60592. Order Number DE90001152. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To predict deposition efficiency, knowledge is required of airway morphometry and the distributions of inhaled airflow. The latter are expected to vary with flow rate and detailed measurements are needed to quantitate this parameter in the human and dog models. These data should provide essential input for the development of modifying factors to incorporate flow dependent, non-homogeneous mass transfer needed for quantitative dosimetry. Full morphometric and inhalation flow distribution measurements on the human and canine airway casts were completed in the current grant period. The work provided new quantitative data of airflow distribution in a realistic central airway cast for two species and for two different airflow patterns; steady inspiratory flow and pulsatile inspiratory flow.

53547 (ETDE-mf–0711711) **Expedemiological studies on the influence of SO_2, NO_X and air-borne dust concentrations on the incidence of in-patient children with stenosing laryngotracheitis in the Bochum city area.** Severien Labayru, J.C. Bochum Univ. (Germany, F.R.). Medizinische Fakultaet. 3 May 1988. 58p. (In German). Order Number DE90711711. Available from NTIS (US Sales Only), PC A04/MF A01.

Based on 1,200 cases of in-patient children with stenosing laryngotracheitis (pseudocroup) and some 250,000 recorded immission measurement data, the possible correlation between disease incidence and SO_2, NO_x, and air-borne dust pollution was studied while considering the space and time conditions in the Bochum city area. Space-related evaluation of exposure to SO_2 and pseudocroup incidence showed a weak positive correlation ($p<0.05$) in 3 measurement years, a negative correlation ($p<0.025$) in 1 measurement year, and no statistically significant correlation in 9 measurement years. Time-related evaluation of different 3-year periods showed at elevated SO_2 concentrations that pseudocroup case numbers were significantly higher but also lower than the expected average. No statistically significant deviation of case number was found at elevated concentrations within the overall study period of 16 years. Evaluation of time-related dependence between NO_2 exposure and pseudocroup case number showed a statistically significant higher case number at elevated concentrations in the total study period of 6 years. However, a causal connetion between both parameters could not be deduced immediately because of possible interfering factors like infection epidemiological ones and others. Time-related evaluation of NO exposure in the 3-year study period and air-borne-dust exposure in the 1-year study period showed no statistical correlation with the corresponding pseudocroup case numbers. (orig.).

53548 (ORNL/FTR–2518) **[Re-evaluation of chemical carcinogenicity]: Foreign trip report, March 7–19, 1987.** Griesemer, R.A. Oak Ridge National Lab., TN (USA). 1 Apr 1987. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017343. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in an international scientific re-evaluation of the epidemiologic and experimental evidence for the carcinogenicity of all 617 agents (chemicals, groups of chemicals, industrial processes, occupational exposures, and cultural habits) that had been previously evaluated in volumes 1–42 of the IARC Monographs on the Evaluation of the Carcinogenic Risk of Chemicals to Humans. The results of the evaluations, to be published as Supplement 7 to the Monograph series, are expected to serve worldwide as the definitive lists of substances carcinogenic to humans. They should serve as the basis for international informational and regulatory efforts to prevent cancers.

53549 (ORNL/FTR–2536) **[The design and interpretation of inhalation studies in toxicology]: Foreign trip report, March 20–April 7, 1987.** Witschi, H. Oak Ridge National Lab., TN (USA). 20 Apr 1987. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017309. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The meeting I attended in Hannover, FRG, dealt with "The Design and Interpretation of Inhalation Studies;" it was a general review of current state-of-the-art inhalation toxicology. At the University of Bern, Switzerland, I learned from Prof. Abelin about current public health problems in Switzerland. An invited seminar was presented at the Central Toxicology Laboratory of ICI, and in Newcastle-on-Type I had the opportunity to discuss my current research with Prof. P. Alexander, an internationally recognized authority in experimental cacinogenesis.

53550 (ORNL/FTR–3393) **[Bioremediation of mercury-contaminated sites]: Foreign trip report, September 9–17, 1989.** Turner, R.R. Oak Ridge National Lab., TN (USA). 27 Sep 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001248. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The purpose of this travel was to allow the traveler to (1) attend the 7th International Conference on Heavy Metals in the Environment held in Geneva, Switzerland; (2) chair two sessions (Wastewater Purification and Organometallic Compounds, respectively) of the conference; and (3) present a paper describing research [supported jointly by the Hazardous Waste Remedial Actions Program (HAZWRAP) of the US Department of Energy (DOE) and the US Environmental Protection Agency (USEPA)] on the bioremediation of mercury-contaminated sites. The title of the paper was "Volatilization, Methylation, and Demethylation of Mercury in a Mercury-Contaminated Stream." The traveler was also a co-author of another paper, "Gene Probes to Predict Responses of Aquatic Microbial Communities to Toxic Metals," which was presented by the USEPA collaborator (T. Barkay). The conference brought together international experts to present and discuss research findings on many aspects of metals in the environment and thus

provided the traveler the opportunity to interact beneficially with researchers in the subfields of mercury biogeochemistry and microbial ecology. The traveler also attended conference sessions on metals and acid deposition, groundwater, wastewater purification, and municipal solid waste. 2 refs.

53551 (PB–89-206734/XAB) **Contribution of wood smoke and motor-vehicle emissions to ambient aerosol mutagenicity.** Lewis, C.W.; Baumgardner, R.E.; Stevens, R.K.; Claxton, L.D.; Lewtas, J. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. Aug 1988. 6p. (EPA–600/J-88/325). Available from NTIS, PC A02/MF A01.

Pub. in Environmental Science and Technology, Vol. 22, No. 8, 968-971(Aug 1988).

A receptor-model analysis of the mutagenicity of ambient fine particles in air samples collected under EPA's Integrated Air Cancer Project has been performed. The analysis was based on multiple linear regression, using measured concentrations of inorganic chemical elements which are good indicators of likely sources of the mutagenicity. This has allowed the determination of the separate contributions made by wood smoke and mobile sources to the mutagenicity measured in a residential neighborhood in Albuquerque, NM. The results is generally consistent with the known potencies of these sources, based on source measurements.

53552 (PB–89-207161/XAB) **Analysis of air-toxics emissions, exposures, cancer risks, and controllability in five urban areas. Volume 1. Base year analysis and results.** Wilson, J.; Istvan, D.; Laich, E.; Lahre, T. Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Jul 1989. 88p. (EPA–450/2-89/012A). Available from NTIS, PC A05/MF A01.

This report is the first phase of a study to define the multiple-source, multiple pollutant nature of the urban air-toxics problem (also known as 'urban soup') and to discern what control measures (or combinations of measures) can best be employed to mitigate the urban air-toxics problem. The report documents the base year analysis, involving dispersion modeling of emissions data for 25 carcinogenic air toxics in five U.S. urban areas and a subsequent exposure/risk assessment to estimate aggregate cancer incidence. Aggregate (multi-source, multi-pollutant) cancer incidence (or population risk) across the 5 cities in this study averaged about 6 excess cases per million persons, ranging from about 2 to 10 in individual cities. The most-important pollutants contributing to aggregate incidence are polycyclic organic matter, 1,3-butadiene, formaldehyde and hexavalent chromium. The most-important sources are road vehicles, comfort and industrial cooling towers, chrome platers, solvent use, and fuel combustion, including wood stoves.

53553 (PB–89-207294/XAB) **Selection of a suitable extraction method for mutagenic activity from woodsmoke-impacted air particles.** Williams, R.; Pasley, T.; Warren, S.; Zweidinger, R.; Watts, R. Environmental Health Research and Testing, Inc., Research Triangle Park, NC (USA). 1988. 20p. Available from NTIS, PC A03/MF A01.

Pub. in International Jnl. of Environmental Analytical Chemistry, Vol. 34, 137-154(1988).

Extraction methods were evaluated for recovery of mutagneic activity from woodsmoke-impacted air particles. Soxhlet and sonication techniques were utilized with a variety of solvents to ascertain the effect of solvent choice, extraction methods, or dissolved gases in extraction solvents on the recovery of mutagenicity. Sonication extraction gave slightly less mass recovery than the Soxhlet method. Methanol extracted more mass than the other solvents with dichloromethane recovering the least. Dissolved gases were not found to have any effect, while mutagenicity was shown to be dependent upon solvent and extraction method. Soxhlet extraction with acetone and toluene/ethanol yielded the highest recovery of mutagenic activity; however, results indicated a solvent/solute interaction which chemically altered one or more extract components. Extraction employing dichloromethane and sonication was selected as a suitable method since this treatment appeared not to alter extracted compounds, and good recovery of mutagenicity was obtained. (Copyright (c) 1988 Gordon and Breach Science Publishers Inc.)

53554 (PB–89-214779/XAB) **Synergistic effects of nitrogen dioxide and carbon dioxide following acute inhalation exposures in rats.** Levin, B.C.; Paabo, M.; Highbarger, L.; Eller, N. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Fire Research. May 1989. 45p. (NISTIR–89/4105). Available from NTIS, PC A03/MF A01.

All fires occurring in air produce carbon dioxide (CO_2). Fire involving nitrogen-containing products will also generate nitrogen dioxide (NO_2), a pulmonary irritant. In Fischer 344 male rats, the LC50 (30 minute exposure plus 14 day post-exposure observation period) for NO_2 was 200 ppm (with 95% confidence limits of 43 to 51%); whereas, the LC50 for NO_2 in the presence of 5% CO_2 was 90 ppm (with 90% confidence limits ranging from 70-120 ppm). Exposure to NO_2 increased the methemoglobin (MetHb) levels in the arterial blood. At the end of the 30 minute exposures, the MetHb levels were 2-3 times higher in the animals exposed to the combination of NO_2 (200 ppm) and CO_2 (5%) than in those exposed to NO_2 only. Deaths from NO_2 were all post-exposure and occurred earlier in the presence of NO_2 plus 5% CO_2 than in the absence of the CO_2. The time of death was concentration-dependent when both gases were present. At death, evidence of hemorrage and extensive edema was observed in the lungs. The mean lung wet weight/body weight ratio from rats exposed to 200 ppm NO_2 with and without 5% CO_2 was 3-4 times that of non-exposed rats. More edema was noted with NO2 and CO_2 than with NO_2 alone.

53555 (PB–89-867451/XAB) **Biological effects and environmental fate of antifouling substances. January 1978-July 1989 (Citations from the Life Sciences Collection data base). Report for January 1978-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 84p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning the environmental effects of antifouling substances used to control biofouling and their eventual fate in the biosphere. Toxicity studies, the effects of regulations on pollution distribution, bioaccumulation and sediment accumulation, resistant organisms, and biodeterioration of antifouling substances are discussed. Antifouling materials considered include copper, nickel, and organotin compounds. Marine fouling, cooling system fouling, and antifouling paints are discussed in separate bibliographies. (Contains 152 citations fully indexed and including a title list.)

53556 (UCRL–100678) **Assessing multiple pathway exposures: Variability, uncertainty, and ignorance.** McKone, T.E. Lawrence Livermore National Lab., CA (USA). Aug 1989. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8906180–2: U.S. EPA/ORNL workshop on municipal waste combustion: deposition, food chain impacts, uncertainty, and research needs, Cincinnati, OH (USA), 8-9 Jun 1989). Order Number DE90001020. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Human populations contact environmental pollutants through food, water, and air in varying amounts each day throughout a lifetime. Thus, a realistic strategy for managing the potential health risks of municipal incinerator emissions requires a comprehensive approach with adequate attention to uncertainties. Using contaminant transfers from air to food as a case study, this paper considers two important issues in exposure assessment–completeness of the exposure model and the treatment of uncertainty in exposure estimates. This case study is used to distinguish between variability (inherent randomness in data), ignorance (incomplete data and/or lack of scientific understanding) and uncertainty (the variance in exposure estimates attributable to the combination of variability and ignorance). For the air/food pathways, I explore the use of pathway exposure factors (PEFs) that combine information on environmental partitioning ("fugacity," biotransfer factors, deposition, etc.) with data on human diet, behavior patterns, and physiology into a numerical expression that links ambient air concentrations in mg/m^3 into daily exposure in mg/kg-d. Following EPA protocol, exposure expresses human contact with contaminants through the lungs, the gut wall, and skin surface. I describe and assess the uncertainty for exposure estimates of incinerator emissions through the air/milk and air/meat pathways. I consider the advantages and disadvantages of

various methods for propagating and analyzing uncertainties. 23 refs., 4 figs., 2 tabs.

53557 **Molecular characterization of somatic gene mutations arising in vivo in humans.** Albertini, R.J. (Genetics Lab., Univ. of Vermont, College of Medicine, Burlington, VT (US)); Nicklas, J.A.; O'Neill, J.P. vp of Monitoring of occupational genotoxicants. Sorsa, M.; Norppa, H. Alan R. Liss Inc., New York, NY (1986). (CONF-8506220--: Monitoring of occupational exposure to genotoxicants: a satellite symposium, Helsinki (Finland), 30 Jun - 2 jul 1985).

Hprt mutant T-cell colonies from 2 normal male individuals were studied. From individual 1, nine control wild type and thirteen hprt mutant colonies were analyzed while from individual 2, one wild type and twelve hprt mutant colonies as well as a bulk (non-mutant) culture were studied. The results of studies of hprt structural alteration sand Ti gene rearrangements in DNA of four wild type and eleven hprt mutant colonies from individual 1 have been reported elsewhere. Using the hprt probe, 3 of the mutants showed major alteration in hprt gene structure and several others showed possible changes on Southern blot analysis. The same filters as were used for the hprt Southern blots were then probed with the Ti β cDNA gene probe, Jurkat 2. A wide variety of different restriction fragments were seen on a Bam HI blot. Every Ti gene pattern except two were unique. The two pairs of duplicate Ti β gene configurations included a wild type and a hprt mutant, both of which appeared to have an unrearranged Ti β gene, and two hprt mutants which had similar or identical Ti gene rearrangements. One of these two mutants had an hprt gene structural alteration and one did not. These clearly derived from separate in vivo clones.

53558 **Application of human sperm parameters for monitoring.** Wyrobek, A.J. (Biomedical Sciences Div., Lawrence Livermore National Lab., Univ. of California, PO Box 5507, Livermore, CA (US)). vp of Monitoring of occupational genotoxicants. Sorsa, M.; Norppa, H. Alan R. Liss Inc., New York, NY (1986). (CONF-8506220--: Monitoring of occupational exposure to genotoxicants: a satellite symposium, Helsinki (Finland), 30 Jun - 2 jul 1985).

Two categories of reproductive effects of toxic exposure are critical for both the individual and the species: changes in fertility and the production of genetically or morphologically defective offspring. Measuring these effects in exposed individuals or populations is generally difficult because of the problems and limitations associated with epidemiologic studies. Some measurements of reproductive damage can be made directly in the exposed man. Here, the status of several current methods used to assess male reproductive damage are briefly reviewed and related to available studies of workplace exposures. Also, some promising new approaches for measuring chromosomal and genetic damage in sperm are described. Each method is discussed in light of mechanism, limitations for human study, and its potential relevance as an indicator of abnormal fertility or adverse reproductive outcome.

53559 **A risk assessment for selected lead-induced health effects: An example of a general methodology.** Whitfield, R.G. (Argonne National Lab., IL (USA)); Wallsten, T.S. *Risk Analysis (USA)*, 9(2): 197-207 (Jun 1989).

The research described here is part of a larger risk assessment project to aid the U.S. Environmental Protection Agency (EPA) in its review of the primary National Ambient Air Quality Standard for lead. The methodology can be applied to many situations in which a policy decision about a toxic substance is required in the face of incomplete data. Numerical results are presented for three potentially adverse lead-induced effects of interest to EPA: elevated erythrocyte protoporphyrin (EP), hemoglobin (Hb) decrement, and intelligence quotient (IQ) decrement.

53560 **The metabolism of 4,8-DiMeIQx in conventional and germ-free rats.** Knize, M.G. (Lawrence Livermore National Lab., CA (USA)); Overik, E.; Midtvedt, T.; Turteltaub, K.W.; Happe, J.A.; Gustafsson, J.A.; Felton, J.S. *Carcinogenesis (UK)*, 10(8): 1479-1484 (Aug 1989).

The aromatic amine mutagen, [^{14}C]2-amino-3,4-8-trimethylimidazo[4,5-f]quinoxaline (4,8-DiMeIQx), which is derived from cooked food, was administered to conventional and germ-free AGUS rats previously fed either a semi-synthetic diet containing the cytochrome P-450 inducer beta-naphthoflavone (BNF) or a control diet without BNF. The germ-free animals had longer fecal transit times and lower induction of 7-ethoxyresorufin-O-deethylase activity than conventional rats. Induction with BNF caused a greater percentage of the radioactivity to be excreted in the feces of both germ-free and conventional rats. Feeding BNF also caused a 4-fold induction in germ-free and a 24-fold induction in conventional rat intestinal enzyme levels. Analysis of the urinary and fecal metabolites showed no consistent differences between conventional and germ-free rats in the metabolite profile. Major metabolites were identified as 8-hydroxymethyl-DiMeIQx, N-acetyl-8-hydroxymethyl-DiMeIQx, and 3-N-dimethyl-4-hydroxy-methyl-DiMeIQx. The data from this study indicate that intestinal microflora do not play a major role in the metabolism of 4,8-DiMeIQx, but the induction of intestinal enzymes does not affect the route and rate of excretion.

53561 (AD-A-208927/4/XAB) **Biomedical studies with the free-electron laser. Final report, 1 February 1986-31 January 1988.** Berns, M.W. Beckman Laser Inst. and Medical Clinic, Irvine, CA (USA). 15 May 1989. 215p. Available from NTIS, PC A10/MF A01.

An electrostatic Van de Graff FEL was used to study the effects of infrared radiation on the synthesis of DNA and RNA in living vertebrate cells in culture. The laser was operated at wavelengths of 165 and 200 microns at power densities of 0.1 - 30 KW/sq.cm. Cells were incubated in radioactive precursors to either DNA or RNA following exposure to the FEL and analyzed by light-microscope autoradiography. The results indicated that the 200 micron wavelength inhibited DNA but not RNA synthesis in a subpopulation of cells and the 165-micron wavelength inhibited RNA synthesis and not DNA synthesis. The statistical significance for the 200 micron wavelength studies was $p = 0.05$ and for the 165 micron wavelength studies $p = 0.001 - 0.005$. 53562 (AD-A-208948/0/XAB) **Inhibition of nucleic acid synthesis in cells exposed to 200-micrometer radiation from the free-electron laser. Final report, 1 February 1986-31 January 1988.** Berns, M.W.; Bewley, W. Beckman Laser Inst. and Medical Clinic, Irvine, CA (USA). 1988. 4p. Available from NTIS, PC A02/MF A01.

Pub. in Photochemistry and Photobiology, Vol. 46, No. 2, 165-167(1988).

Vertebrate tissue culture cells were exposed to 200-micrometer-wavelength radiation 100 W/sq cm from a free electron laser (FEL) of the electrostatic generator type. Cell cultures demonstrated no morphological alterations but a statistically significant ($p < or = .05$) proportion of the cells exhibited inhibition of DNA synthesis. This study demonstrates the first biological effects of the FEL and the feasibility of performing biological investigations with this device.

53563 (AD-A-208951/4/XAB) **Direct gene transfer into human cultured cells facilitated by laser micropuncture of the cell membrane.** Tao, W.; Wilkinson, J.; Stanbridge, E.J.; Berns, M.W. Beckman Laser Inst. and Medical Clinic, Irvine, CA (USA). Jun 1987. 5p. Available from NTIS, PC A02/MF A01.

Pub. in Proceeding of the National Academy of Sciences, Vol. 84, 4180-4184(Jun 1987).

The selective alteration of the cellular genome by laser microbeam irradiation has been extensively applied in cell biology. We report here the use of the third harmonic (355 nm) of an yttrium-aluminum garnet laser to facilitate the direct transfer of the neo

gene into cultured human HT1080-6TG cells. The resultant transformants were selected in media containing an aminoglycoside antibiotic, G418. Integration of the neo gene into individual chromosomes and expression of the gene were demonstrated by Southern blot analyses, microcell-mediated chromosome transfer, and chromosome analyses. The stability of the integrated neo gene in the transformants was shown by a comparative growth assay in selective and nonselective media. Transformation and incorporation of the neo gene into the host genome occurred at a frequency of 8x10-4-3x10-3. This method appears to be 100-fold more efficient than the standard calcium phosphate-mediated method of DNA transfer.

53564 (AD-A–208979/5/XAB) **Activity of retinal ganglion cells following intense, nanosecond laser flashes. Final report, 1983-1986.** Glickman, R.D. Krug International, San Antonio, TX (USA). Technology Services Div. 1989. 19p. Available from NTIS, PC A03/MF A01.

Pub. in Clin. Vision Sci.; Vol. 4, No. 1, 1-18(1989).

The effects of intense, but nonlesion-producing, laser exposures of 20-ns duration were determined on the light responses and spontaneous activity of retinal ganglion cells recorded in situ from the rhesus monkey. (Following a single, 20-ns exposure centered on its receptive field, a ganglion cell produced an 'afterdischarge' of maintained action potentials). The duration of the afterdischarge depended on the diameter of the laser beam on the retina and on the beam's intensity. Laser exposures subtending 0.5 to 2.0 deg, and delivering 45 to 60% of the maximum permissible exposure, elicited afterdischarges that lasted up to 80 s. When the beam diameter was decreased to 0.25 deg, the afterdischarge was reduced to 30 s, and to less than 5 s with the 0.12-deg beam. Light sensitivity after the laser exposure recovered rapidly during the first 10 s and then more slowly, but exponentially, until it reached the preflash level. Color-opponent ganglion cells exhibited a phenomenon called 'response-reversal' after the laser exposure, presumably due to selective adaptation of a mid-wavelength cone-input. Because a 20-ns exposure, regardless of intensity, is likely to photoregenerate more than half of the available visual pigment, the effects of ganglion cell response described here are not likely to be due solely to pigment bleaching.

53565 (AD-A–208988/6/XAB) **Lack of behavioral effects in the rhesus monkey: High peak microwave pulses at 1.3 GHz.** D'Andrea, J.A.; Cobb, B.L.; de Lorge, J.O. Naval Aerospace Medical Inst., Pensacola, FL (USA). 1989. 13p. Available from NTIS, PC A03/MF A01.

Pub. in Bioelectromagnetics, Vol. 10, 65-76(1989).

The current safety standards for radiofrequency and microwave exposure do not limit the peak power of microwave pulses for general or occupational exposures. While some biological effects, primarily the auditory effect, depend on pulsed microwaves, hazards associated with very high peak-power microwave pulses in the absence of whole-body heating are unknown. Five rhesus monkeys, Macaca mulatta, were exposed to peak-power densitites of 131.8 W/sq cm (RMS) while performing a time-related behavioral task. The task was composed of a multiple schedule of reinforcement consisting of three distinct behavioral components: inter-response time, time discrimination, and fixed interval. Trained monkeys performed the multiple schedule during exposure to 1.3-GHz pulses at low pulse-repetition rates (2-32 Hz). No significant change was observed in any behavior during irradiation as compared to sham-irradiation sessions. Generalization of these findings to experimental results with higher peak-power densities, other pulse rates, different carrier frequencies, or other behaviors is limited.

53566 (PB–89-202717/XAB) **Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 1. Final report.** Nelson, J.T.; Wilson, G.P. New York City Transit Authority, Brooklyn, NY (USA). Mar 1989. 108p. Available from NTIS, PC A06/MF A01.

See also Volume 2, PB–89-202725.

Under the sponsorship of the Urban Mass Transportation Administration's Technical Assistance program, the New York City Transit Authority (NYCTA) studies the noise-reduction effectiveness of various resilient rail fasteners for steel elevated structures. The study included field and laboratory tests, and limited theoretical modeling to identify and optimize those characteristics most effective in reducing noise, while meeting criteria for rail stability. Top-plate bending resonance in the 500-700 Hz frequency range may be a significant factor in reducing the vibration-isolation effectiveness of resilient rail fasteners. The standing-wave elastomer resonance (thickness mode) of resilient fasteners does not appear to be significant to wayside noise reduction at 500 Hz or lower frequencies for the type of fasteners considered.

53567 (PB–89-202725/XAB) **Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 2. Final report.** Nelson, J.T.; Wilson, G.P. New York City Transit Authority, Brooklyn, NY (USA). Mar 1989. 416p. Available from NTIS, PC A18/MF A01.

See also Volume 1, PB–89-202717. Portions of this document are not fully legible.

53568 (LA–11679-PR) **Water supply at Los Alamos during 1988: Progress report.** Purtymun, W.D.; Maes, M.N.; McLin, S.G. Los Alamos National Lab., NM (USA). Oct 1989. 37p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. Order Number DE90000871. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The municipal and industrial water supply during 1988 was 1459 $\times 10^6$ gal. from wells in three fields, and 34 $\times$ 10{ 6} gal. from the spring gallery in Water Canyon. About 2.4 $\times 10^6$ gal. of water from the Guaje Reservoir and 1.4 $\times 10^6$ gal. from the Los Alamos Reservoir were used for irrigation; thus, the total water usage in 1988 was about 1497 $\times 10^6$ gal. The water supply was satisfactory in that production met the demand and water quality in the distribution system was in compliance with state and federal regulations. 22 refs., 6 figs., 6 tabs.

53569 (SAND–89-1177) **Geotechnology publications and related reports: A bibliography, January–December 1988.** Tolendino, C. (ed.). Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 66p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE90000896. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This document is a collection of abstracts of papers prepared as part of the Sandia programs in the GeoEnergy Technology Department and other closely related research. Areas of technology represented are resource access (drilling, blasting), resource extraction (enhanced recovery) and geodiagnostics. More basic work in the Geosciences is in a separate chapter. Industry programs and Technology Transfer constitute a final section. That section also includes our geotechnical support to DOE on the Strategic Petroleum Reserve in which we work closely with the SPR site contractor. 65 refs.

53570 (NUREG/CR–3252) **New England seismotectonic study activities during fiscal year 1980.** Barosh, P.J.; Smith, P.V. Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering; Boston Coll., Weston, MA (USA). Weston Observatory. Sep 1989. 227p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A11/MF A01 - GPO - OSTI.

The Fiscal Year 1980 New England Seismotectonic Program consisted of thirty separate but coordinated studies covering New England and adjacent Canada, which are described in this report. Those studies can be grouped into eight separate categories. (1) Regional and local earthquake activity were studied and seismic hazard estimates made, an earthquake catalogue was developed for the period 1534–1977, and a seismometer array was installed in the Moodus, Connecticut seismic area. (2) The causes of seismicity along the northern Fall Zone from New Jersey to Connecticut were investigated. (3) The level of activity of faults in the Champlain-Hudson area were investigated. (4) Geologic mapping of fault systems was conducted in the Adirondack Mountains. (5) Geophysical studies were carried out in southern New England. (6) Geologic mapping was accomplished at selected locations to study Mesozoic and younger tectonics. (7) Brittle fractures in bedrock were mapped within areas of seismicity to determine if there is a relationship between these features and earthquakes. (8) Vertical crustal movements along the coast of Maine were studied. 94 refs., 88 figs., 34 tabs.

53571 (PNL-SA–17154) **The design and use of an electrically driven core sampler capable of obtaining marine sediment cores through dense substrates.** Word, J.Q.; Ward, J.A.; Coley, J.A.; Gibson, C.L. Pacific Northwest Lab., Richland, WA (USA). Jun 1989. 6p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. (CONF-8909128–3: Oceans '89 conference, Seattle, WA (USA), 18-21 Sep 1989). Order Number DE90001393. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Two new core samplers were designed and constructed to collect marine sediment as part of a US Army Corps of Engineers (USACE) program in Oakland Harbor, Oakland, California. A vibratory-hammer core and a vibratory-hammer split core were developed that can obtain sediment cores through dense substrates. The corers were used during three sampling cruises and found to be effective in obtaining relatively undisturbed samples from normally compacted to hard-packed coastal and estuarine sediment. 1 ref., 2 figs.

53572 (UCRL–101709) **A study of the difference between gravimetric and gamma-gamma density near the surface in northern Yucca Flat.** Hearst, J.R.; Burkhard, N.R. Lawrence Livermore National Lab., CA (USA). [1989]. 50p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909163–2: 5. symposium on containment of underground nuclear detonations, Santa Barbara, CA (USA), 19-21 Sep 1989). Order Number DE89017886. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Although the mean and median of the difference between average density from 50 to 200 m below the surface in 43 holes in northern Yucca Flat computed from a density log and that computed from borehole gravity using the measured free air gradient is very close to zero, the range of values is very large. Many individual values of the difference are significantly different from zero. When the gravimetric density is computed using a free air gradient calculated from the surface gravity on an irregular but approximately 300 m grid, the mean and median of the difference between gravimetric and gamma-gamma density is slightly closer to zero than when the measured free air gradient is used. The range of values is not significantly decreased. Proposed explanations for this large range fall into two categories: anomalies in the gravity field or its horizontal derivative at the sites with large difference range, causing changes in the free air gradient or the near-surface gravimetric density, and mechanisms that affect the bulk density near the borehole, causing changes in the gamma-gamma density. We have investigated many proposed explanations and have found no single mechanism that is consistent with the data. These results indicate that the choice of method of determining free air gradient causes no significant change in the difference between near-surface gamma density and gravimetric density, and that there is no obvious method of eliminating the range. Because calculation from surface gravity is much less expensive than tower measurement, and there is no evidence that it is less accurate, we consider it the logical method for routinely obtaining free air gradient until some evidence is found to suggest the contrary. We are attempting to optimize the calculational procedure. The tradeoff is between the accuracy of the calculated free air gradient and the amount of surface gravity data required. 8 refs., 19 figs., 1 tab.

53573 (WHC-SA–0600) **Transmission of low-magnitude seismic excitation into Hanford Site structures.** Weiner, E.O. Westinghouse Hanford Co., Richland, WA (USA). Aug 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-87RL10930. (CONF-8910192–10: 2. DOE natural phenomena hazards mitigation conference, Knoxville, TN (USA), 3-5 Oct 1989). Order Number DE90001238. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Several Hanford Site buildings were analyzed using simplified models to gain insight as to what extent the free field motion of a small-magnitude earthquake is transmitted into building structures as a result of soil-structure interaction effects. Building selection included the Plutonium Processing Plant, B-Plant and the Fast Flux Test Facility containment which represented a variety of stiffnesses, weights, and embedments. An artificial time history for the free field has a peak response at 13 Hz. This motion represents a median for magnitude 4 and 4.5 earthquakes, respectively. Floor response spectra were compared with results from analyses to design basis ground motions using the same structural models. Considerable attenuation of the small-magnitude free-field motion was found in the case of stiff, deeply embedded structures. This attenuation is attributed to kinematic interaction in addition to attenuation with depth in the free field. Even with such attenuation, there are exceptions where small magnitude responses exceed design basis responses. They are generally associated with 10 to 20 Hz modes with vertical motion. 6 refs., 6 figs., 1 tab.

53574 (SAND–89-1197) **Quasi-static and dynamic mechanical properties of a granite and a sandstone.** Olsson, W.A. Sandia National Labs., Albuquerque, NM (USA). Sep 1989. 10p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC04-76DP00789. Order Number DE89016963. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The quasi-static failure criteria, elastic constants, and p-wave velocities have been determined for a granite and a sandstone in which blasting experiments are being carried out by the Advanced Technology Division (6258). In addition, the dynamic strength of the granite was measured using a Kolsky bar. Both rocks show a linear increase in strength with increasing confining pressure. The dynamic strength of the granite is as much as 330% greater than the quasi-static value. The strength of the granite was also dependent on the angle between the foliation and the loading direction. There was a 20% difference in the p-wave velocity between that measured parallel to and perpendicular to the bedding in the sandstone. 4 refs., 4 figs., 5 tabs.

53575 (ENEA-RT-TIB–85-4) **Rare earths in environmental and geological samples: Neutron activation analysis.** Moauro, A.; Madaro, M. ENEA, Casaccia (Italy). Dipt. Tecnologie Intersettoriali di Base. Feb 1985. 14p. (In Italian). Order Number DE89793116. Available from NTIS (US Sales Only), PC A03/MF A01.

Neutron activation analysis allows the determination of rare earth elements (REEs) with a sensitivity much higher than non-nuclear methods. In this paper, this technique was applied to determine REEs in environmental samples, such as marine suspended particulate matter and sea, lake and river sediments. The importance of

lanthanides in the environmental field is due to the fact that some REEs, because of their nearly identical physical-chemical behavior, can simulate the environmental behavior of actinides, generated by activation or fission processes. Am(3) can be simulated by Eu(3) and Nd(3), that can simulate also Cm(3). As regards REEs in geological studies, their distribution and fractionation in rocks provide information about the genesis and the evolution of the rocks themselves. Some data relevant to Kenya rocks are presented.

53576 (ESA-SP–285-VOL-1, pp. 8) **Computer simulations of cosmic-ray diffusion near supernova remnant shock waves.** Max, C.E. (California Univ., Berkeley (USA)); Zachary, A.L.; Arons, J. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

A plasma simulation model was used to study the resonant interactions between streaming cosmic-ray ions and a self-consistent spectrum of Alfven waves, such as might exist in the interstellar medium upstream of a supernova remnant shock wave. The computational model is a hybrid one, in which the background interstellar medium is an MHD fluid and the cosmic-rays are discrete kinetic particles. The particle sources for the electromagnetic fields are obtained by averaging over the fast cyclotron motions. When the perturbed magnetic field is larger than 10 percent of the background field, the macro- and microphysics are no longer correctly predicted by quasi-linear theory. The particles are trapped by the waves and show sharp jumps in their pitch-angles relative to the background magnetic field, and the effective ninety-degree scattering time for diffusion parallel to the background magnetic field is reduced to between 5 and 30 cyclotron periods. Simulation results suggest that Type 1 supernova remnants may be the principal sites of cosmic ray acceleration.

53577 (ESA-SP–285-VOL-1, pp. 4) **The electron beam instability revisited: Growth above and below f sub p.** Cairns, I.H. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The growth of electrostatic waves near the plasma frequency (fp) due to an unstable electron beam is investigated by solving the unmagnetized electrostatic dispersion equation numerically. The numerical solutions are compared with analytic theories for reactive (or fluid-type) and kinetic versions of the beam instability, and for the O'Neil/Malmberg connection of the beam and Langmuir modes. Conditions for growth significantly above or below fp are given. Three general results are found: (1) The unstable waves do not grow on a mode with Langmuir dispersion except in the limit of a very dilute beam with growth on O'Neil/Malmberg's connected mode; (2) The properties of the unstable mode depend strongly on beam parameters such as beam density, speed and temperature; and (3) The frequency of maximum growth frequently lies significantly above or below fp, and differs significantly from that predicted by the Langmuir dispersion relation. Results imply important consequences for theories of strong turbulence and nonlinear wave-wave processes, and observational identification of fp from observed wave frequencies.

53578 (ESA-SP–285-VOL-1, pp. 5) **Dissipation of Alfven waves in solar coronal arches.** Sudan, R.N.; Similon, P.L. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The physical mechanism by which mechanical energy is delivered to and absorbed by the solar corona is discussed. A set of MHD equations for analyzing the slow evolution of the magnetic field and the fast time of Alfven waves is presented. Alfven wave dissipation is treated. It is shown that the slow motion of the feet of coronal arches leads to irregular magnetic fields and that Alfven waves propagating in the irregular magnetic structure are dissipated through filamentation of the wave packet that generates short scales necessary for efficient dissipation.

53579 (ESA-SP–285-VOL-1, pp. 117-124) **Relativistic shocks in electron-positron plasmas and polar cap accretion onto neutron stars: Two non-linear problems in astrophysical plasma physics.** Arons, J. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Particle simulations and theory of relativistic shock waves in an e+ e- plasma simulation are outlined. Magnetic reflection of particles is an essential role in the shock structure. Instability of the reflected particles in the shock front produces intense extraordinary mode radiation. Such shocks are candidates for the particle accelerator in plerions and in extragalactic jets only if the upstream Poynting flux composes no more than 10 percent of the total. Analytical and numerical studies of radiation dominated accretion onto the magnetic poles of neutron stars are summarized. The upper limit to the photon luminosity depends upon magnetic confinement, not upon the dragging of photons into the star. Numerical solutions show the plasma forms large scale photon bubbles. The percolative loss of radiation controls the pressure and therefore the limits of magnetic confinement. Loss of magnetic confinement through resistive interchange instability is suggested as a means of generating TeV to PeV voltage drops along the magnetic field.

53580 (ESA-SP–285-VOL-1, pp. 137-141) **Relativistic MHD from two-fluid hydrodynamics (TFHD).** Kennel, C.F. (Abastumani Astrophysical Observatory, Georgia, USSR); Gedalin, M.E.; Lominadze, J.G. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

It is shown that the expected MHD equations may be derived from the relativistic two-fluid hydrodynamical equations, when current velocities are assumed negligible when compared to the mass flow velocity. It is found that MHD does not work in the inner part of the pulsar magnetosphere at radii smaller than that of the light cylinder. The plasma has a very anisotropic pressure and one can expect the firehose instability to develop from only the light cylinder. However, MHD works in the outer parts of the magnetosphere.

53581 (ESA-SP–285-VOL-1, pp. 153-155) **Shock-associated plasma density fluctuations in the interstellar medium.** Spangler, S.R. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Theories of diffuse shock acceleration of the cosmic rays that predict that there should be regions of intense Alfven waves both

upstream and downstream of the shock front are considered. Observations of similar waves near solar system shock waves show that they produce substantial density fluctuations. Such density fluctuations might produce observable scattering of radio waves. Observations which searched for angular broadening or blurring of radio sources whose lines of sight pass close to or through supernova remnants are discussed. No definite cases of remnant-associated scattering are detected. However, the source CL 4, which is viewed through the Cygnus Loop supernova remnant, may be such an object and merits further observation.

53582 (ESA-SP–285-VOL-1, pp. 239-242) **Effects of unequal particle number densities on Alfven waves.** Cairns, I.H. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Analytic plasma theory and numerical solutions of the dispersion equation are used to show that the assumption that the linear properties of the waves are determined by a charge-neutral plasma in the absence of the nonthermal particles, while the nonthermal particles cause growth or additional damping superposed onto the background, is seriously flawed even for stable plasmas. Even when the nonthermal particles do not contribute significantly to the dispersion equation, unequal thermal electron and ion number densities (due to the presence of the nonthermal particles) may cause fundamental low wave number modifications to the Alfven modes, including the creation of a new resonance and severely modified dispersion. These results are found for both cold and warm plasmas. Previous work on Alfven waves should be reevaluated in view of these results.

53583 (ESA-SP–285-VOL-1, pp. 243-246) **A new model of PeV gamma-ray sources.** Smith, I.A.; Katz, J.I. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

A model for the proton acceleration connected with accreting X-ray binaries is proposed. Acceleration is assumed to occur on the closed (dipole) field lines of the neutron star where the density is low and collisional losses of the energetic protons are small. Protons can be mirrored at the poles and become trapped, affording time for them to be accelerated gradually. Eventually, high energy protons escape by diffusing onto open field lines. It is postulated that potential energy of the matter accreting on the open field lines is transferred to Alfven waves that accelerate the protons on the closed field lines. Proton synchrotron radiation may be detectable from the GeV gamma-ray region to the infrared.

53584 (ESA-SP–285-VOL-1, pp. 247-250) **Neutron starquakes and the nature of gamma-ray bursts.** Madau, P.; Blaes, O.; Blandford, R.D.; Goldreich, P. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The possibility that gamma-ray bursts originate from quakes deep in the solid crust of a neutron star is investigated. Seismic waves are radiated if shear stress is relieved by brittle fracture. However they cannot propagate directly to the surface but are temporarily trapped below a reflecting layer. The shaking of the stellar surface couples the seismic waves to Alfven waves which propagate out into the magnetosphere. The crust-magnetosphere transmission coefficient strongly increases with wave frequency and magnetic field strength. Alfven wave luminosities sufficient to power galactic gamma-ray bursts are possible if magnetic fields greater than 100 billion G cover at least part of the stellar surface. As the Alfven waves propagate out into the low density magnetosphere, they become increasingly charge starved, thereby accelerating particles to relativistic energies.

53585 (ESA-SP–285-VOL-1, pp. 251-254) **Are supernova remnants quasi-parallel or quasi-perpendicular accelerators.** Spangler, S.R.; Leckband, J.A.; Cairns, I.H. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Observations of shock waves in the solar system which show a pronounced difference in the plasma wave and particle environment depending on whether the shock is propagating along or perpendicular to the interplanetary magnetic field are discussed. Theories for particle acceleration developed for quasi-parallel and quasi-perpendicular shocks, when extended to the interstellar medium suggest that the relativistic electrons in radio supernova remnants are accelerated by either the Q parallel or Q perpendicular mechanisms. A model for the galactic magnetic field and published maps of supernova remnants were used to search for a dependence of structure on the angle Phi. Results show no tendency for the remnants as a whole to favor the relationship expected for either mechanism, although individual sources resemble model remnants of one or the other acceleration process.

53586 (ESA-SP–285-VOL-1, pp. 281-283) **Global kinetic theory of astrophysical jets.** Chang, T. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

It is suggested that an astrophysical plasma stream flowing outward from a central object along an open magnetic field line with decreasing field strength generally has anisotropic velocity distributions. The electron distribution function of this type of plasma streams contains a thermally populated region and a stretched out high energy tail (or jet-like) region collimated in the outward direction of the magnetic field line. The argument is based on a global, collisional, kinetic theory. Because the kinetic jets are always pointed along the outward direction of the field lines, they are automatically collimated and assume the geometries dictated by the magnetic field. This result should be useful in the understanding of the basic structures of astrophysical objects as extragalactic radio jets, stellar winds, the solar wind, planetary polar winds, and galactic jets (e.g., SS433).

53587 (ESA-SP–285-VOL-1, pp. 285-289) **Nonlinear oblique whistlers: Their relevance to nonthermal coupling of ions and electrons in accretion flow and supercritical quasi-perpendicular collisionless shocks.** Chang, T. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

It is demonstrated that oblique whistlers may be effective in coupling and energizing plasma populations during accretion flow onto massive central objects such as black holes. These plasma collective modes could be excited by inverse ion-populations in perpendicular velocity space such as the ring-like and loss-cone type of distributions, or cross-field drifts induced by the gravitational and magnetic fields, reflection across high-Mach number collisionless shocks, density and/or magnetic field gradients. Nonlinear and turbulent states of these plasma collective modes can accelerate the electrons to large energies. It is suggested that the same nonlinear plasma modes may play a central role in the description of the structure of supercritical quasi-perpendicular collisionless shocks.

53588 (ESA-SP–285-VOL-1, pp. 381-384) **On the existence and stability of intermediate shocks.** Coppi, P.S. (California Univ., Los Angeles (SUA)); Blandford, R.D.; Kennel, C.F. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The question of the existence of intermediate shock waves is examined. It is pointed out that the MHD Rankine-Hugoniot conditions allow up to four types of intermediate shock discontinuity and that one of these is evolutionary. Numerical simulations, analyses of spacecraft data, and theoretical arguments suggest that intermediate shocks can form and be stable. Intermediate discontinuities are classified graphically and the preshock conditions under which they can exist are elucidated. No definitive conclusion is reached concerning the physical reality of intermediate shocks.

53589 (FNAL/C–89/188-T) **Gamma ray lines from dark matter annihilation.** Giudice, G.F. Fermi National Accelerator Lab., Batavia, IL (USA). Aug 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8905222–1: Topical seminar on astrophysics and particle physics, San Miniato (Italy), 8-12 May 1989). Order Number DE90000779. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

If direct annihilation of dark matter particles into a pair of photons occurs in the galactic halo, a narrow γ-ray line can be discovered at future γ-ray detectors sensitive to the GeV region. The signals predicted by different dark matter candidates are analyzed. 16 refs., 3 figs.

53590 (INIS-mf–12006, pp. 117-118) **Trebbin - another meteorite with a complex irradiation history?.** Heusser, G. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The stone meteorite Trebbin has a deficit in short lived cosmogenic radionuclides like (^{57}Co $CT_{1/2}$ = 271.8 d), ^{54}Mn ($T_{1/2}$ = 312.5 d), ^{22}Na ($T_{1/2}$ = 2.60 a), but is normal in its content of long lived ^{26}Al ($T_{1/2}$ = 0.716 Ma). This finding can best be explained by a break-up of the meteoroid into a small body that the nucleonic cascade could hardly develop. This should have happened one to three years before its fall on Earth. (orig.).

53591 (INIS-mf–12006, pp. 118) **Assemblage, composition, and possible thermal history of Fremdlinge in the Ca-Al-rich inclusion 477B from the Vigarano chondrite.** Caillet, C. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); El Goresy, A.; Zinner, E.K.; Goldstein, J.; Velde, D. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Ferropericlase-bearing Fremdlinge were discoverd in a Ca-Al-rich inclusion in the Vigarano chondrite (CV3). The coexisting metal indicates fast cooling to 500^{0}C. Measurements of oxygen isotopes of coexisting spinels indicate the lowest δ^{18}O and δ^{17}O values ever encountered in CAI spinels. (orig.).

53592 (INIS-mf–12006, pp. 140) **Maximum energies of particles, which are accelerated by supernova remnant shockwaves in a stellar wind.** Biermann, P.L. (Max-Planck-Institut fuer Radioastronomie, Bonn (Germany, F.R.)); Voelk, H.J. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Diffusive shock acceleration, balanced by adiabatic losses, leads readily to particle energies $\geq 10^{15}$ eV in the case of a supernova freely expanding into a stellar wind cavity. (orig.).

53593 (INIS-mf–12006, pp. 140) **The structure of weak cosmic ray mediated shocks.** Zank, G.P. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Webb, G.M.; McKenzie, J.F. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The self-consistent non-linear structure of weak shocks modified by cosmic rays has been studied and the stability of such shocks has been considered. The structure of the Halley bow shock has been discussed in terms of this model. (orig.).

53594 (INIS-mf–12006, pp. 140-141) **A cosmic ray driven plasma instability.** Zank, G.P. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

It is shown that the forward propagating sub-Alfvenic mode is unstable on wavelength scales greater than 1 par sec. The role of this instability in astrophysical models is considered. (orig.).

53595 (INIS-mf–12006, pp. 141) **Hydrodynamic turbulence and shock waves in the hot phase of ISM.** Fedorenko, V.N. (AN SSSR, Leningrad. Fiziko-Tekhnicheskij Inst.); Markiewicz, W.J. 53596 (IPNO-TH–87-66) **Bogomol'nyi bounds for cosmic strings.** Comtet, A.; Gibbons, G.W. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Sep 1987. 20p. Order Number DE90713773. Available from NTIS (US Sales Only), PC A03/MF A01.

We establish Bogomol'nyi inequalities for the deficit angle of some cylindrically symmetric asymptotically local flat (CALF) spacetimes containing cosmic strings. These results prove the stability against arbitrary cylindrical deformations of those configurations which saturate the bound. Such configurations satisfy first order equations which can, in some cases, be solved exactly.

53597 (IYaF–89-23) **Magnetic field generation by acoustic oscillations in solar atmosphere.** Ryutov, D.D.; Ryutova, M.P. AN SSSR, Novosibirsk (USSR). Inst. Yadernoj Fiziki. 1989. 9p. (In Russian). Order Number DE90606054. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

MN-10066.

The role of acoustic waves in plasma current excitation and magnetic field generation in the Sun atmosphere is considered. Equations describing the force effecting the electron gas due to waves and equations determining the magnetic field evolution are derived. 5 refs.; 2 figs.

53598 (LAPP-TH–220-88) **Weakly interacting massive particles and stellar structure.** Bouquet, A.; Kaplan, J.; Martin, F. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. 1988. 38p. Order Number DE90713777. Available from NTIS (US Sales Only), PC A03/MF A01.

The existence of weakly interacting massive particles (WIMPs) may solve both the dark matter problem and the solar neutrino problem. Such particles affect the energy transport in the stellar cores and change the stellar structure. We present the results of an analytic approximation to compute these effects in a self-consistent way. These results can be applied to many different stars, but we focus on the decrease of the ^{8}B neutrino flux in the case of the Sun.

53599 (LA-UR–89-863) **The softest Einstein AGN [active galactic nuclei].** Cordova, F.A.; Kartje, J.; Mason, K.O.; Mittaz, J.P.D. Los Alamos National Lab., NM (USA). [1989]. 10p. Sponsored by U.S. DOE Defense Programs; National Aeronautics and Space Administration. DOE Contract W-7405-ENG-36. (CONF-891127–1: Einstein to AXAF conference, Cambridge, MA (USA),

Nov 1989). Order Number DE89009389. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have undertaken a coarse spectral study to find the softest sources detected with the Imaging Proportional Counter (IPC) on the Einstein Observatory. Of the nearly 7700 IPC sources, 226 have color ratios that make them candidate "ultrasoft" sources; of these, 83 have small enough errors that we can say with confidence that they have a spectral component similar to those of the white dwarfs Sirius and HZ 43, nearby stars such as α Cen and Procyon, and typical "polar" cataclysmic variables. By means of catalog searches and ground-based optical and radio observations we have thus far identified 96 of the 226 candidate soft sources; 37 of them are active galactic nuclei (AGN). In the more selective subset of 83 sources, 47 have been identified, 12 of them with AGN. The list of 47 identifications is given in Cordova et al. For one QSO in our sample, E0132.8–411, we are able to fit the pulse-height data to a power-law model and obtain a best fit for the energy spectral index of 2. $2_{-0.4}^{+0.6}$. For the remainder of the AGN in the higher confidence sample we are able to infer on the basis of their x-ray colors that they have a similar spectral component. Two-thirds of the AGN are detected below 0.5 keV only, while the remainder evidence a flatter spectral component in addition to the ultra-soft component. 14 refs., 5 figs.

53600 (LA-UR–89-3200) **Thermonuclear Runaway model.** Sparks, W.M.; Kutter, G.S.; Starrfield, S.; Truran, J.W. Los Alamos National Lab., NM (USA). [1989]. 13p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-8906225–1: Physics of classical novae: IAU colloquium no. 122, Madrid (Spain), 27-30 Jun 1989). Order Number DE90000690. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The nova outburst requires an energy source that is energetic enough to eject material and is able to recur. The Thermonuclear Runaway (TNR) model, coupled with the binary nature of nova systems satisfies these conditions. The white dwarf/red dwarf binary nature of novae was first recognized as a necessary conditions by Kraft. The small separation characteristic of novae systems allows the cool, red secondary to overflow is Roche lobe. In the absence of strong, funneling magnetic fields, the angular momentum of this material prevents it from falling directly onto the primary, and it first forms a disk around the white dwarf. This material is eventually accreted from the disk onto the white dwarf. As the thickness of this hydrogen-rich layer increases, the degenerate matter at the base reaches a temperature that is high enough to initiate thermonuclear fusion of hydrogen. Thermonuclear energy release increases the temperature which in turn increases the energy generation rate. Because the material is degenerate, the pressure does not increase with temperature, which normally allows a star to adjust itself to a steady nuclear burning rate. Thus the temperature and nuclear energy generation increase and a TNR results. When the temperature reaches the Fermi temperature, degeneracy is lifted and the rapid pressure increase causes material expansion. The hydrogen-rich material either is ejected or consumed by nuclear burning, and the white dwarf returns to its pre-outburst state. The external source of hydrogen fuel from the secondary allows the while process to repeat. 43 refs., 8 figs.

53601 (LA-UR–89-3288) **A quasi-economic role for lunar science.** Jones, E.M. Los Alamos National Lab., NM (USA). [1989]. 12p. Sponsored by National Aeronautics and Space Administration. DOE Contract W-7405-ENG-36. (CONF-8910229–1: 40. congress of the International Astronautical Federation, Malaga (Spain), 7-13 Oct 1989). Order Number DE90000679. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In broad economic terms, the development of lunar products will begin with a sequence of technology, production, and delivery demonstrations which will have to precede the emergence of markets. Economically viable products will tend to be those for which the sum of production and transport costs are lower for lunar suppliers than for terrestrial suppliers. As long as lunar production costs exceed terrestrial production costs – as will be the case for most lunar products until such time as lunar development has reached a mature stage – the most viable industries will be those producing low-tech products for lunar markets. The scale of initial lunar markets will depend on the size of a lunar base and/or its rate of growth. For a given level of public support, maximum base size can be achieved through the conduct, at the base, of a vigorous program of scientific and engineering research making use of as much local production and as many permanently-resident support staff as feasible. 5 refs.

53602 (MPE-PREPRINT–131) **The 158 micron (CII) mapping of the galactic center molecular clouds.** Genzel, R.; Stacey, G.J.; Townes, C.H.; Poglitsch, A.; Geis, N. Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Oct 1988. 8p. (ETN–89-94392). Available from Fachinformationszentrum Karlsruhe, 7514 Eggenstein-Leopoldshafen 2, Federal Republic of Germany.

Maps are made with a 55 sec resolution in the region of the curved, thermal filaments and the 20 to 50 km per sec molecular clouds in Sgr A. The emission is spatially well correlated with the radio continuum in the filaments. The large intensity radiation excludes shock as the origin of the ionization.

53603 (MPE-PREPRINT–133) **Strong, spatially extended CO 7 to 6 emission from luminous cloud cores: W51 and DR21.** Jaffe, D.T.; Genzel, R.; Harris, A.I.; Lugten, J.B.; Stacey, G.J.; Stutzki, J. Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Oct 1988. 38p. (ETN–89-94394). Available from Fachinformationszentrum Karlsruhe, 7514 Eggenstein-Leopoldshafen 2, Federal Republic of Germany.

It is concluded that three distinct molecular cloud components contribute to the CO 7 vs 6 emission, including the warm, dynamically active material which accounts for 75 percent of the velocity integrated CO emission from the two sources; a warm, quiescent material associated with the HII regions in each source; and a cool (20 to 40K) quiescent gas, which overlies some of the hot material.

53604 (N–89-23547, pp. 367-382) **The space particle environment.** Vampola, A.L. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. May 1989. (NASA-CP–3035-PT-2;L–16575-PT-2;NAS–1.55:3035-PT-2;CONF-8806434–: NASA/SDIO space environmental effects on materials workshop, Hampton, VA (USA), 28 Jun - 1 jul 1988). In *NASA/SDIO Space Environmental Effects on Materials Workshop, part 2.* Available from NTIS, PC A12/MF A01.

The energetic charged particle environment in the Earth's magnetosphere was studied. An overview is provided of trapped particle morphology, the geometry of the trapping regions, the radiation environmental models, the current status of these models, and future modelling requirements.

53605 (N–89-23547, pp. 495-509) **An overview of charging environments.** Gabriel, S.B.; Garrett, H.B. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. May 1989. (NASA-CP–3035-PT-2;L–16575-PT-2;NAS–1.55:3035-PT-2;CONF-8806434–: NASA/SDIO space environmental effects on materials workshop, Hampton, VA (USA), 28 Jun - 1 jul 1988). In *NASA/SDIO Space Environmental Effects on Materials Workshop, part 2.* Available from NTIS, PC A12/MF A01.

A brief synopsis of the natural environments that play a role in spacecraft charging is presented. Environments that cause both surface and internal charging are discussed along with the mechanisms involved. The geosynchronous and low altitude regions of the Earth's magnetosphere/ionosphere are considered and simple descriptions of each environment presented. As material properties are critical to the charging process, definition of material properties important to charging, which can be affected by the environment, are also described. Several space experiments are proposed that would help fill the gaps in the knowledge of the performance of materials in a charging environment.

53606 (N–89-24142) **Direct electron-pair production by high energy heavy charged particles. Final report, April 15, 1988-15 October 1989.** Takahashi, Y.; Gregory, J.C.; Hayashi, T.; Dong, B.L. Alabama Univ., Huntsville, AL (USA). May 1989. 20p. (NASA-CR–184958;NAS–1.26:184958). Available from NTIS, PC A03/MF A01.

Direct electron pain production via virtual photons by moving charged particles is a unique electro-magnetic process having a substantial dependence on energy. Most electro-magnetic processes, including transition radiation, cease to be sensitive to the incident energy above 10 TeV/AMU. Thus, it is expected, that upon

establishment of cross section and detection efficiency of this process, it may provide a new energy measuring technique above 10 TeV/AMU. Three accelerator exposures of emulsion chambers designed for measurements of direct electron-pains were performed. The objectives of the investigation were to provide the fundamental cross-section data in emulsion stacks to find the best-fit theoretical model, and to provide a calibration of measurements of direct electron-pairs in emulsion chamber configurations. This paper reports the design of the emulsion chambers, accelerator experiments, microscope measurements, and related considerations for future improvements of the measurements, and for possible applications to high energy cosmic ray experiments. Also discussed are the results from scanning 56m of emulsion tracks at 1200x magnification so that scanning efficiency is optimized. Measurements of the delta-ray range spectrum were also performed for much shorter track lengths, but with sufficiently large statistics in the number of measured delta-rays.

53607 (N–89-24162) **Solar and stellar coronal plasmas. Semiannual report Nos. 12-17, 1 May 1986-30 April 1989.** Golub, L. Smithsonian Institution, Cambridge, MA (USA). Smithsonian Astrophysical Observatory. Apr 1989. 177p. (NASA-CR–184909;NAS–1.26:184909). Available from NTIS, PC A09/MF A01.

Progress in observational, theoretical, and radio studies of coronal plasmas is summarized. Specifically work completed in the area of solar and stellar magnetic fields, related photospheric phenomena and the relationships between magnetism, rotation, coronal and chromospheric emission in solar-like stars is described. Also outlined are theoretical studies carried out in the following areas, among others: (1) neutral beams as the dominant energy transport mechanism in two ribbon-flares; (2) magneto hydrodynamic and circuit models for filament eruptions; and (3) studies of radio emission mechanisms in transient events. Finally, radio observations designed for coronal activity studies of the sun and of solar-type coronae are described. A bibliography of publications and talks is provided along with reprints of selected articles.

53608 (N–89-24233) **The Allegheny Observatory search for planetary systems. Final technical report, 1980-1988.** Gatewood, G.D. Pittsburgh Univ., PA (USA). Apr 1989. 12p. (NASA-CR–184990;NAS–1.26:184990). Available from NTIS, PC A03/MF A01.

The accomplishments of the observatory's search for planetary systems are summarized. Among these were the construction, implementation, and regular use of the Multichannel Astrometric Photometer (MAP), and the design, fabrication and use of the second largest refractor objective built since 1950. The MAP parallax and planetary observing programs are described. Various developments concerning alternate solid state photodetectors and telescope instrumentation are summarized. The extreme accuracy of the system is described in relation to a study of the position and velocity of the members of the open cluster Upgren 1. The binary star system stringently tests the theory of stellar evolution since it is composed of an evolved giant F5 III and a subgiant F5 IV star. A study that attempts to measure the luminosities, surface temperatures, and masses of these stars is discussed.

53609 (N–89-24251) **Redistribution in astrophysically important hydrogen lines.** Cooper, J.; Ballagh, R.J.; Hubeny, I. Joint Inst. for Lab. Astrophysics, Boulder, CO (USA). May 1989. 8p. (NASA-CR–181375;NAS–1.26:181375). Available from NTIS, PC A02/MF A01.

Under typical solar chromospheric conditions for hydrogen radiators, strong collisions due to both electrons and ions are well separated in time, so that a binary collision theory for collisional redistribution is applicable. However, a simple impact approximation may not be used, but rather a unified type theory is required in which frequency dependent line shape parameters are used to describe both impact and quasi-static regions of the spectrum. In addition, correlated terms which describe absorption and emission during a collision are important, and, in fact, without correlated terms describing both transfer of excitation and emission during the same collision unphysical predictions (such as negative intensities) would be obtained. In this paper theory is specifically developed for the coupled Lyman-alpha, Lyman-beta, Hydrogen-alpha system, and equations of statistical equilibrium and absorption and emission coefficients are given. All correlated events are examined and emission during a collision is found to be important in the line wings. Stimulated emission and absorption is also included within a broadband approximation. The major approximation is to ignore lower state interaction. It is found that for Lyman-beta Raman-coupling with Hydrogen-alpha occurs and the overall scattering of radiation in the line wings is mostly coherent. In contrast, for Hydrogen-alpha, incoherent redistribution due to lower state radiative decay (which occurs even in the absence of collisions) is found to dominate the coherent scattering. Finally, in the Lyman series the dominant incoherent contribution is associated with cascade transitions and inelastic collisions between different principal quantum states.

53610 (N–89-24260) **Rapid fitting of particle cascade development data from X-ray film densitometry measurements.** Roberts, E.; Benson, C.M.; Fountain, W.F. National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center. Jun 1989. 18p. (NASA-TM–100368;NAS–1.15:100368). Available from NTIS, PC A03/MF A01.

A semiautomatic method of fitting transition curves to X-ray film optical density measurements of electromagnetic particle cascades is described. Several hundred singly and multiple interacting cosmic ray events from the JACEE 8 balloon flights were analyzed using this procedure. In addition to greatly increased speed compared to the previous manual method, the semiautomatic method offers increased accuracy through maximum likelihood fitting.

53611 (N–89-25079) **IUE investigations of SN 1987A. Semiannual status report, August 1988-February 1989.** Kirshner, R.P. Harvard Coll. Observatory, Cambridge, MA (USA). May 1989. 36p. (NASA-CR–184973;NAS–1.26:184973). Available from NTIS, PC A03/MF A01.

IUE observations of the SN 1987A began shortly after the discovery and have been frequent through 1988 and 1989, using the fine error sensor for photometry, low dispersion spectra for the supernova spectrum, and high dispersion observations for the interstellar medium when the supernova was bright and for circumstellar gas surrounding the supernova as the initial event faded. The UV data were very useful in determining which star exploded, assessing the ionizing pulse produced as the shock hit the surface of the star, and in constraining the stellar evolution that preceded the explosion through observations of a circumstellar shell.

53612 (ORNL/FTR–2747) **[Terrestrial space radiation and its effects]: Foreign trip report, October 10–25, 1987.** Fry, R.J.M. Oak Ridge National Lab., TN (USA). 6 Nov 1987. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017297. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This NATO ASI Workshop was planned to inform graduate students about: radiation environments in space, the dosimetry involved, the formulation of models to predict environments, the prediction of solar flares, the potential health effects of exposure below the magnetosphere, within the magnetosphere and in deep space, the effects of HZE particles, the possibilities of interactions between microgravity and radiation and risk estimates and radiation protection. The faculty consisted of 10 workers from Europe and 9 from the US. The students ranged from graduate students to fairly senior scientists who had an interest in such an interdisciplinary workshop. The "students" came from Belgium, England, France, Germany, Greece, South Africa, Spain, Switzerland, Turkey, and the USA. The workshop consisted of formal lectures by the faculty, panel discussions led by a faculty member and presentations by students. My role was to present lectures on radiation effects on tissues, radiation induced cancer risk estimates of both non-stochastic and stochastic effects and to report on how NCRP Scientific Committee 75, which I chaired, derived the new radiation protection guidelines for space workers and astronauts.

53613 (PB–89-207393/XAB) **Solar-Geophysical Data Number 537, May 1989. Part 1 (prompt reports). Data for April, March 1989, and late data.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). Jul 1987. 151p. (SGD–537-PT-1). Available from NTIS, PC A08/MF A01.

See also Part 2, PB–89-173401 and PB–89-173041.

Solar data are presented for March and April, 1989. The data include sunspot activity indices; solar flares in the H-alpha line; solar radio emissions at 3, 10, 21, and 43 cm; and mean solar magnetic fields.

53614 (PB–89-207401/XAB) **Solar-Geophysical Data Number 537, May 1989. Part 2 (comprehensive reports). Data for November 1988 and miscellaneous.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). Jul 1987. 96p. (SGD–537-PT-2). Available from NTIS, PC A05/MF A01.

See also PB–89-207393.

Solar data are presented for November 1988. The data include solar flares in the H-alpha line; solar radio bursts at fixed frequencies; interplanetary solar particles and plasma; solar x-ray radiation as seen from the GOES-7 artificial satellite; mass ejections from the sun; and active prominences and filaments.

53615 (RRK–89-14) **Light propagation and the distance-redshift relation in a realistic inhomogeneous universe.** Futamase, Toshifumi; Sasaki, Misao. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. May 1989. 25p. Order Number DE90710101. Available from NTIS (US Sales Only), PC A03/MF A01.

We investigate the propagation of light rays in a clumpy universe constructed by cosmological version of the post-Newtonian approximation. We show that the linear approximation to the propagation equations is valid in the region z < or approx 1 even if the density contrast is much larger than unity. Based on a general order-of-magnitude statisfical consideration, we argue that the linear approximation is still valid for z < or approx 1. Then we give a general formula for the distance-redshift relation in a clumpy universe and derive an explicit expression for a simplified situation in which the effect of the gravitational potential of inhomogeneities dominates. In the light of the derived relation we discuss the validity of the Dyer-Roeder distance. Furthermore, we consider a simple model of an inhomogeneous universe and investigate statistical properties of light rays. We find that the result of this specific example also supports the validity of the linear approximation. (author).

53616 **Evolution of cosmic string networks.** Albrecht, A. (National Aeronautics and Space Administration/Fermilab Astrophysics Center, Fermi National Accelerator Laboratory, Batavia, Illinois 60510 (US)); Turok, N. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 973-1001 (15 Aug 1989).

A discussion of the evolution and observable consequences of a network of cosmic strings is given. A simple model for the evolution of the string network is presented and related to the statistical mechanics of string networks. The model predicts the long-string density throughout the history of the Universe from a single parameter, which we calculate in radiation-era simulations. The statistical mechanics arguments indicate a particular "thermal" form for the spectrum of loops chopped off the network. Detailed numerical simulations of string networks in expanding backgrounds are performed to test the model. Consequences for large-scale structure, the microwave and gravity-wave backgrounds, nucleosynthesis, and gravitational lensing are calculated.

53617 **Stress-energy tensors for vector fields outside a static black hole.** Barrios, F.A. (Department of Physics, University of Cincinnati, Cincinnati, Ohio 45221 (US)); Vaz, C. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1340-1343 (15 Aug 1989).

We obtain new, approximate stress-energy tensors to describe gauge fields in the neighborhood of a Schwarzschild black hole. We assume that the coefficient of $\nabla^2 R$ in the trace anomaly is correctly given by ζ-function regularization. Our approximation differs from that of Page and of Brown and Ottewill and relies upon a new, improved ansatz for the form of the stress-energy tensor in the ultrastatic optical metric of the black hole. The Israel-Hartle-Hawking thermal tensor is constructed to be regular on the horizon and possess the correct asymptotic behavior. Our approximation of Unruh's tensor is likewise constructed to be regular on the future horizon and exhibit a luminosity which agrees with Page's numerically obtained value. Geometric expressions for the approximate tensors are given, and the approximate energy density of the thermal tensor on the horizon is compared with recent numerical estimates.

53618 **Fermions in an Aharonov-Bohm field and cosmic strings.** Gerbert, P.d.S. (Center for Theoretical Physics, Laboratory for Nuclear Science dge, Massachusetts 02139 (US)). *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1346-1349 (15 Aug 1989).

The scattering of fermions by an infinitely thin flux tube is governed by a Dirac Hamiltonian that requires specification of a one-parameter self-adjoint extension. This Aharonov-Bohm scenario arises generically for cosmic strings. In particular for some range of the extension parameter the string can bind fermions.

6402 Atmospheric Physics

53619 (AD-A–208943/1/XAB) **Production of very energetic electrons in a discrete aurora. Technical report.** Swift, D.W.; Gorney, D.J. Aerospace Corp., El Segundo, CA (USA). Laboratory Operations. 26 Apr 1989. 21p. (TR–0088(3940-06)-7). Available from NTIS, PC A03/MF A01.

Data are presented showing that acceleration of electrons to energies in excess of 100 keV sometimes occurs on field lines associated with discrete auroral arcs. Velocity distributions suggest that acceleration is in directions primarily perpendicular to the magnetic field. The examples studied in the S3-3 data set indicate that the process can occur in the altitude range from the topside ionosphere to 5500 km. The favored explanation is that the field-aligned beam excites upper hybrid waves when it interacts with the dense ionospheric plasma. The waves efficiently scatter the beam both in energy and pitch angle.

53620 (AD-A–209063/7/XAB) **Inverse scattering: Ionospheric structure determination. Final technical report, 1 July 1979-30 June 1980.** Cohen, J.M. Pennsylvania Univ., Philadelphia, PA (USA). Dept. of Physics. Aug 1980. 45p. Available from NTIS, PC A03/MF A01.

A paper entitled 'Curved Space Scattering' was sent to AFOSR. The abstracts of the paper and report contain statements of the research accomplished. In addition, following problems were studied: the Kanal-Moses variational principle was used to treat the synthetic data discussed in the report listed in 1.1. It was found that if the initial trial function is within 10% of the actual result, then the K-M variational principle gives the result to better than 1%. The results of Kay were generalized for n-poles in such a way that practical applications are possible, e.g., to the ionosphere. To test the method, the 4- and 10-pole cases are being studied before treating the 100-pole case.

53621 (AD-A–209251/8/XAB) **Ionospheric variability. Final report, October 1985-October 1988.** Paul, A.K. Naval Ocean Systems Center, San Diego, CA (USA). Mar 1989. 13p. (NOSC/TR–1277). Available from NTIS, PC A03/MF A01.

This report summarizes the results of a study of short-term variations of the ionosphere. The digital ionograms used in this analysis were recorded at Brighton, Colorado, many of them at a high rate of 12 ionograms per hour and faster. The results show that oscillations of the electron-density distribution take place in the F region with varying amplitudes and with periods of a fraction of an hour. The oscillations are coupled with varying tilts. Rapid changes, mainly of the electron density, are also observed at E-layer heights and many records indicate that the echoes come from tilted sporadic-E patches with relatively small dimensions.

53622 (AD-A–209348/2/XAB) **Auroral E-fields from DE-1 and -2 at magnetically conjugate points.** Weimer, D.R. Regis Coll., Weston, MA (USA). Research Center. 1988. 13p. (SCIENTIFIC–4). Available from NTIS, PC A03/MF A01.

Pub. in Advanced Space Research, Vol. 8, No. 9, 9373-9384(1988).

The results of studies of the electric-field measurements from the two Dynamics Explorer satellites are reviewed. There are times at which DE-2 measured electric fields at the auroral ionosphere while DE-1 obtained nearly simultaneous measurement at a higher altitude on the same magnetic field lines. When these electric fields are mapped to a common altitude, it is found that the large-scale electric fields are similar, but the small-scale electric fields have a larger amplitude at the higher altitude. Through the use of Fourier

analysis it is shown that these results are evidence for a magnetic field-aligned potential drop between the two satellites. While these results were made possible by the satellites' altitude separation, it is also possible to take advantage of the fact that the satellites may pass through the same geomagnetic location with a time separation. This was useful for confirming that sinusoidal electric-field oscillations which were detected near one conjunction were due to spatial rather than temporal variations, since similar oscillations were found at the same location at different times. The observed spatial oscillations can be explained by a simple model of magnetosphere-ionosphere coupling.

53623 (AD-A–209542/0/XAB) **Electric fields in earth orbital space. Final report.** Pfitzer, K.A. McDonnell Douglas Astronautics Co., Huntington Beach, CA (USA). May 1989. 30p. Available from NTIS, PC A03/MF A01.

During the last few years the author has worked on the entry of solar wind into the magnetosphere and on the control the interplanetary magnetic field (IMF) has on the magnetosphere. Correlative data conclusively prove that both the solar wind and the IMF exert considerable influence on magnetospheric processes, and the magnetospheric substorm in particular. The work on this subject may be roughly divided into two parts, particle entry and representation of the interaction of the IMF with the magnetosphere. Particle entry is discussed first. The author has quantitatively determined where on the magnetopause that low energy (solar wind) charged particles can gain entry to the magnetosphere.

53624 (ESA-SP–285-VOL-2, pp. 217-221) **Magnetotail reconnection, MHD theory and simulations.** Birn, J. (Ruhr Univ., Bochum (Germany, F.R.)); Hesse, M.; Schindler, K. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94476;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Reconnection in Space Plasma, volume 2.* Available from NTIS, PC A15/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Magnetotail reconnection leading to plasmoid formation and ejection is discussed, emphasizing three-dimensional structures and deviations from earlier imposed symmetries, based on MHD simulations and topological considerations. In general, the separation of the plasmoid takes a finite amount of time. During this stage the plasmoid is characterized by filamentary structures of interwoven flux tubes with different topological connections.

One and two-dimensional particle stimulations are used to study ion beam driven instabilities within the plasma sheet boundary layer (PSBL) and the consequences these instabilities have in terms of plasma heating. It shown that when cold lobe plasma convects into the PSBL and interacts with the ion beams, two wave modes can be driven unstable, the electron acoustic and ion-ion two stream instabilities; these waves heat the cold electrons and cold ions close to plasma sheet temperatures.

European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94476;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Reconnection in Space Plasma, volume 2.* Available from NTIS, PC A15/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

A topological analysis of a simple model magnetic field of a perturbation at the magnetopause modeling an apparent flux transfer event is presented. It is shown that a localized perturbation at the magnetopause can in principle open a closed magnetosphere by establishing magnetic connections across the magnetopause. Although the model field exhibits neutral points, these are not involved in the magnetic connection of the flux tubes. The topological substructure of a localized perturbation is analyzed in a simpler configuration. The presence of both signs of the magnetic field component normal to the magnetopause leads to a linkage of topologically different flux tubes, described as a flux knot, and a filamentary substructure of field lines of different topological types which becomes increasingly complicated for decreasing magnetic shear at the magnetopause.

53627 (ESA-SP–285-VOL-2, pp. 269-274) **Multiple X line reconnection at the dayside magnetopause.** Lee, L.C. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94476;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Reconnection in Space Plasma, volume 2.* Available from NTIS, PC A15/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

Studies on magnetic reconnection are reviewed. The multiple X line reconnection model for the flux transfer events; the criterion for the transition from the single X line to the multiple X line reconnection; a global simulation of the dayside magnetopause reconnection; a particle simulation of single X line reconnection and multiple X line reconnection; a patchy reconnection mechanism; and a mechanism for the generation of cusp-region hydromagnetic waves are discussed.

53628 (N–89-23547, pp. 569-572) **Trapped particle flux models at NSSDC/WDC-A-R/S.** Bilitza, D.; Sawyer, D.M.; King, J.H. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. May 1989. In *NASA/SDIO Space Environmental Effects on Materials Workshop, part 2.* Available from NTIS, PC A12/MF A01.

The data needed in the future for trapped particle modeling are summarized. A short summary of past and future modeling activities and a list of satellite data that have not yet been considered in the modeling efforts is included.

53629 **Suprathermal electrons at Earth's bow shock.** Gosling, J.T. (Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Thomsen, M.F.; Bame, S.J.; Russell, C.T. *Journal of Geophysical Research (USA),* 94(A8): 10011-10026 (1 Aug 1989).

A hot, suprathermal population of electrons is often present near the Earth's bow shock. The overall morphology of this hot population as observed with the Los Alamos/Garching fast plasma experiments on ISEE 1 and 2 in the energy range from 1 to 20 keV is much as described previously by others working primarily with more energetic particle measurements. In particular, at energies below 20 keV the flux of suprathermal electrons is most intense immediately downstream from the shock and decreases in intensity with increasing penetration into the magnetosheath. Upstream fluxes of electrons in this energy range are generally considerably weaker than are the downstream fluxes. The major new results from our ISEE measurements are as follows: (1) The suprathermal electrons are commonly found downstream from perpendicular and quasi-perpendicular portions of the shock but not downstream from quasi-parallel portions. (2) The suprathermal electron spectrum extends smoothly out of the shocked solar wind spectrum generally as a power law in energy with an exponent in the range from −3 to −4. (3) Angular distributions for the suprathermal electrons are generally isotropic immediately downstream of the shock ramp, but an anisotropy perpendicular to the magnetic field usually develops with increasing penetration into the magnetosheath. (4) Suprathermal electrons are often first observed within the shock layer itself as a field-aligned beam escaping upstream.

53630 Ion reflection and downstream thermalization at the quasi-parallel bow shock. Gosling, J.T. (Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Thomsen, M.F.; Bame, S.J.; Russell, C.T. *Journal of Geophysical Research (USA)*, 94(A8): 10027-10038 (1 Aug 1989).

It is well known that for sufficiently high Mach numbers (typically $M_f > 2$) ion reflections is the primary process by which ion energy dissipation is initiated at quasi-perpendicular, collisionless shocks in space. In this paper we present evidence from ISEE 2 measurements that coherent ion reflection is also often an important element of the ion energy dissipation process at high Mach numer, quasi-parallel shocks. Such coherent reflection is not evident in a number of published hybrid simulations of quasi-parallel shocks wherein the dissipation process appears to be associated primarily with incoherent scattering of solar wind ions in the upstream and downstream wave fields. However, such reflection is present in other simulation results. The main evidence for coherent ion reflection as an important element in achieving dissipation at quasi-parallel shocks is the following: (1) A cold secondary (to the solar wind) beam of ions is often observed within the ramp of the shock where the magnetic field intensity rises precipitously and where the major electron heating occurs. Typically this secondary beam of ions has a velocity space position roughly consistent with specular reflection of a portion of the solar wind ions incident on the shock. (2) Downstream from the shock, a relatively dense and cool core ion population is typically observed, accompanied by either multiple ion bunches or, more commonly, a suprathermal ion shell. (These populations are in addition to the extremely hot, tenous diffuse ion which appear nearly ubiquitously both upstream and downstream from the shock.) The downstream core and shell (or bunches) are believed to represent directly transmitted solar wind ions and reflected and later scattered ions, respectively, with the motions of the latter population accounting for a large fraction of the ion energy dissipated at the shock.

53631 Dynamics of a plasma expanding into a uniform magnetic field. Gisler, G. (Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Lemons, D.S. *Journal of Geophysical Research (USA)*, 94(A8): 10145-10150 (1 Aug 1989).

A heuristic model of an energetic plasma expanding into an initially uniform magnetic field is presented. In this model the plasma is cylindrically shaped, perfectly diamagnetic, and allowed to expand freely in the direction of the magnetic field. It results in a time evolution of the cylindrical radius described by Airy functions and parameterized by the plasma β. For instance, the maximum extent of the radius scales as $\beta^{1/3}$ while the maximum radial deceleration scales as $\beta^{-1/3}$. Time evolution and scaling are compared both with other models and with two-dimensional electromagnetic particle simulations. A spherically symmetric model is also found to agree well with the simulations and results in simpler expressions for the maximum radius and maximum radial deceleration. The larger deceleration obtained in these models, as compared with models that ignore the axial expansion, would shift toward longer wavelengths the peak growth of the instability thought to be responsible for the field-aligned structures seen in the Active Magnetospheric Particle Tracer Explorers (AMPTE) magnetotail releases. © American Geophysical Union 1989

Pub. in Jnl. of Physics A, Vol. 21, 4577-4591(1988).

The development of high-power lasers has made it possible to achieve light intensities of the order of one atomic unit. At these field strengths relativistic effects become important. It is thus of interest to study multiphoton ionization from the point of view of quantum electrodynamics (QED). In recent work Filipowicz (1985) obtained the solution of the Dirac equation for an electron interacting with a quantized electromagnetic plane wave. He also discussed the non-quantum limit of this solution. The authros here solve the Dirac equation for an electron interacting with a quantized and elliptically polarized electromagnetic field. The use the solution to obtain a relativistic S-matrix amplitude for multiphoton ionization in the high-intensity limit. Its non-relativistic limit is also derived and is used to construct a multiphoton transition-rate formula which is compared with previous results.

53633 (AD-A–209343/3/XAB) **Photodetachment cross sections of negative halogen ions in discharge media.** Wang, W.C.; Lee, L.C. San Diego State Univ., CA (USA). Dept. of Electrical and Computer Engineering. 1988. 9p. Available from NTIS, PC A02/MF A01.

Pub. in Phys. D: Applied Phys. Vol. 21, 675-682(1988).

Photodetachment of negative halogen ions occurs in the atmosphere and in discharge systems. The photodetachment cross section of negative halogen ions are generally of interest for the studies of laser and plasma physics. Laser-induced increases of discharge current were observed in the discharge media containing various halogen compounds (F_2, HF, HCl, Cl_2, HBr, CH_3Br, CH_3I and CH_2I_2) in N_2. The increase of transient current were attributed to the photodetachment of negative ions in the discharge media. On the basis of general considerations, the negative ions present in the discharge are assumed to be the atomic halogen negative ions. Photodetachment cross sections were determined from the current increases as a function of laser flux. Photodetachment cross sections of F-, Cl-, Br- and I- are (0.75, 2.5, 3.3 and 7.0) x 10^{-17} sq cm at 193 nm and (0.6, 1.0, 1.5 and 3.0) x 10^{-17} sq cm at 248 nm, respectively. These data are compared with the earlier results of negative-ion-beam experiments and theoretical calculations.

53634 (AD-A–209360/7/XAB) **Broadening and shifting of the Raman Q branch of HD.** Rosasco, G.J.; May, A.D.; Hurst, W.S.; Petway, L.B.; Smyth, K.C. National Inst. of Standards and Technology, Gaithersburg, MD (USA). 15 Feb 1989. 11p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Chemical Physics, Vol. 90, No. 4, 2115-2124(15 Feb 1989).

The line broadening and shifting of the vibrational Q branch in pure HD has was measured for transitions J = 0 to 3 at room temperature over the density range 0.8 to 10.6 amagat. The shifting and broadening coefficients were determined with an uncertainty of + or - .0002/cm/amaget, which now provides a discriminating test for various semiclassical and quantal theoretical calculations. The line broadening coefficients are compared with linewidth data from other spectroscopic branches and with measurements of the rates of state-to-state rotational energy transfer. Use of an exponential gap law for the rates of rotational energy transfer allows estimates to be made of the contributions to the linewidths from rotationally inelastic, elastic vibrational dephasing, and elastic reorientation processes. This analysis suggests that rotational energy transfer occurs approximately 30% faster in v = 1 than in v = 0.

53635 (AD-A–209466/2/XAB) **State-resolved cross sections for rotationally inelastic collisions of NH_2(x2B1 state) with helium.** Dagdigian, P.J. Johns Hopkins Univ., Baltimore, MD (USA). Dept. of Chemistry. 1 Mar 1989. 11p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Chemical Physics, Vol. 90, No. 5, 2617-2625(1 Mar 1989).

Integral cross sections for rotational transitions from the lowest orthorotational level (zero 0,0) of Amidogen (NH_2) induced by collisions with helium have been measured in a crossed beam experiment. A pulsed supersonic beam of rotationally cold NH_2 was produced by 193 nm photolysis of a dilute mixture of ammonia in argon seed gas at the tip of a nozzle; the helium target was also prepared as a pulsed beam. The final rotational state populations (without spin-state resolution) in the Ka = 0 and 1 manifolds of NH_2 were interrogated in the collision zone by dye laser fluorescence excitation in the A2A1 yields X2B1 reverse band system. Because of the rotational selection rules in the band system, it was not possible to put the cross sections for the two Ka manifolds on the same scale. Within a given Ka manifold, there is a marked preference for collisional transitions with the smallest DeltaN change. These experimental results are compared to calculated close-coupling rotationally inelastic cross sections for H_2O (zero 0,0 state)-helium collisions.

53636 (AD-A–209522/2/XAB) **Traps for neutral atoms. Annual summary report, 1 September 1987-31 August 1988.** Pritchard, D.E. Massachusetts Inst. of Tech., Cambridge, MA (USA). Research Lab. of Electronics. 7 Jun 1989. 5p. Available from NTIS, PC A02/MF A01.

The author concentrated on radio-frequency resonance experiments on magnetically trapped neutral atoms. R.F. resonance of trapped atoms is valuable for at least three reasons: as a high-resolution diagnostic of the atoms' individual and collective behavior, as a tool to selectively manipulate the magnetic quantum states of the trapped atoms, and potentially for ultrahigh-resolution spectroscopy of isolated atomic systems. Following the successful demonstration of r.f. induced transitions on trapped neutral atoms, he proceeded to increase the number (approx. x 10^{10}) and confinement time ($tau_{1/e}$ = 30 minutes) of trapped sodium atoms so that he had sufficient signal to time to perform r.f. resonance measurements as a diagnostic of the effects of Doppler cooling on the atoms' energy distribution. An r.f. resonance curve for a hyperfine transition was obtained by measuring the relative peak heights of the fluoresence spectrum for the two states as function of the frequency of the applied r.f. resonance curve for 'hot' atoms (after initial loading of the trap) were much wider than that of 'cool' atoms after application of longitudinal Doppler cooling. The author found that Doppler cooling of the sample required a very weak standing wave laser beam to avoid excess heating of the transverse degree of freedom.

X-ray emission in collisions of slow multicharged ions with metallic surfaces were studied for the development of an ECR source. The used projectiles are slow Neon ions, Ne^{9+} and Ne^{10+}. A very large number of electrons are captured by the projectile. Twe correlated electrons may decay simultaneously in the K and L shell with the emission of one photon with an energy equal to the summed energies of the two transitions.

53638 (CONF-890953–7) **Is YbAs a heavy Fermion system?.** Monnier, R.; Degiorgi, L.; Delley, B.; Koelling, D.D. Argonne National Lab., IL (USA). Aug 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International conference on the physics of highly correlated electron systems; Santa Fe, NM (USA); 11-15 Sep 1989. Order Number DE90001446. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Using parameters extracted from a tight binding fit to an ab initio band structure, the specific heat anomaly observed in YbAs around 5 K is computed within the infinite U limit of the degenerate Anderson impurity model. Applying the renormalization procedure derived in variational treatments of the periodic Anderson model, a quasiparticle Fermi surface with strong nesting features and small mass enhancements is obtained. The results suggest that YbAs is not a "classical" heavy Fermion system. 28 refs., 3 figs., 1 tab.

Atomic line profiles, molecular line intensities, continua from radiative dissociation, and radiation during close collisions, are phenomena that can be used to study atomic and molecular interactions. Recent progress with experiments and calculations for the case of atomic and molecular hydrogen is discussed here. 4 refs.

53641 (IEIE–8802, pp. 3) **Current status and future aspect of nitrogen plasma.** Ikuta, Nobuteru (Univ. of Tokushima (Japan)). Institute of Electrical and Information Engineers (Japan). 5 Sep 1988. (In Japanese). (CONF-8810337–Pt.2: Joint convention record of institutes of electrical and information engineers, Niigata (Japan), 3-5 Oct 1988). In *Papers on lectures for joint conference of societies related to electricity and information.* Available from NTIS (US Sales Only), PC A02/MF A01.

Nitrogen plasma is filled with active species which have high internal energy, and creates a very active state. The outline of the active species in nitrogen plasma is reviewed, and methods of their application are studied. The N_2 molecule has the highest dissociation energy among the diatomic molecules, and many of the excited atoms have long lives. The N_2 molecule has various long-life stable excitation levels. $A_3\epsilon u?$ particularly has conditions for easy gaining in the population, and plays the leading role. Brief explanation is made on the vibrational excitation level, and molecular and atomic ions. Nitrogen gas produces plasma with high resistivity which includes active species having potential (internal) energy in various levels, and nitrogen mixed gases are used in various systems where plasma is applied. As regards applications and future aspect of nitrogen plasma, summarized reports on laser, ozonizer, synthesis of ammonia, nitride ceramic, cermet, and processing of semiconductor elements are made. 10 references, 1 figure, 2 tables.

53642 (IEIE–8802, pp. 4) **Electrolytic dissociation process in nitrogen and produced species.** Ito, Haruo (Chiba Institute of Technology (Japan)). Institute of Electrical and Information Engineers (Japan). 5 Sep 1988. (In Japanese). (CONF-8810337–Pt.2: Joint convention record of institutes of electrical and information engineers, Niigata (Japan), 3-5 Oct 1988). In *Papers on lectures for joint conference of societies related to electricity and information.* Available from NTIS (US Sales Only), PC A02/MF A01.

Out of the active species comprising active nitrogen, metastable excitation molecule $A^3\Sigma u?$ and dissociated atom N are explained about the reaction (loss) and relaxation processes. Study on the data obtained so far, laying stress on metastable excitation process of $A^3\Sigma u?$, showed an extremely wide variation. It was because of the variance in effective levels depending on measurement conditions. The measured values of the radiation lives of $A^3\Sigma u?$ were 1-30 seconds except for a group. The large values of 10-30 seconds for the group seems possibly to be the values including cascade effect by the recombination of N atoms. The values of approximately 150 +1-20 (cm^2 s^{-1}) have been reported for the measurements of diffusion coefficients. The values of quenching rate coefficients with O_2 and N_2 are shown. One of the factors for maintaining the activity of nitrogen processing is the N atoms produced by dissociation. 84 references, 3 figures, 3 tables.

53646 (IPNO-DRE–89-06) **Excitation of giant resonances in heavy ion reactions at intermediate energies.** Suomijaervi, T.; Beaumel, D.; Blumenfeld, Y.; Chomaz, P.; Frascaria, N.; Garron, J.P.; Roynette, J.C.; Scarpaci, J.A.; Barrette, J.; Fernandez, B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1989. 14p. Order Number DE90713758. Available from NTIS (US Sales Only), PC A03/MF A01.

Giant resonances in ^{90}Zr and ^{208}Pb have been studied by inelastic scattering of heavy ions using the SPEG spectrometer at Ganil. Intermediate energy heavy ions are compared to light ions as a probe to study giant resonances and the high cross sections and peak-to-background ratios obtained with heavy projectiles are stressed. It is shown that also in the case of heavy ions an accurate multipole analysis can be performed when a high resolution spectrometer is used. The influence of the Coulomb interaction on the excitation of the resonances is discussed.

53647 (IPNO-DRE–89-07) **Spin-flip transitions in ^{46}Ti, ^{48}Ti and ^{50}Cr excited by inelastic proton scattering.** Willis, A.; Morlet, M.; Marty, N.; Djalali, C.; Bohle, D.; Richter, A.; Stein, H. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1989. 25p. Order Number DE90713759. Available from NTIS (US Sales Only), PC A03/MF A01.

Forward angle cross sections for 1^+ states have been measured in the non closed shell nuclei ^{46}Ti, ^{48}Ti, ^{50}Cr by 201 MeV proton inelastic scattering. The total measured 1^+ strength is compared with microscopic distorted wave impulse approximation calculations using large scale shell model wave functions. The quenching for the 1^+ strength ranges from 0.3 to 0.5. For the low energy isovector 1^+ states the ratio of the orbital to the spin excitation is extracted.

53648 (ISN–88-73) **Quasi fusion of $^{139}La + {}^{12}C$ at intermediate energies. A study within the Landau Vlasov approach.** Suraud, E.; Schuck, P.; Pi, M. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Jul 1988. 57p. Order Number DE90713761. Available from NTIS (US Sales Only), PC A04/MF A01.

An extensive study of the La + C reaction at 50 MeV/u is presented. A quasi fusion residue is found for any but very peripheral impact parameters, in agreement with recent experimental results. The same reaction is studied at higher energies and an approximate lower threshold for fusion is given. More symmetric systems are calculated showing a somewhat different behaviour.

53649 (ISN–88-75) **Semiclassical and phase space approaches to dynamic and collisional problems of nuclei.** Hasse, R.W.; Gregoire, C.; Remaud, B.; Jaenicke, J.; Schuck, P. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Sep 1988. 49p. Order Number DE90713760. Available from NTIS (US Sales Only), PC A03/MF A01.

This article summarises recent work on the semiclassical (Thomas-Fermi like) treatment of nuclear correlations and dynamical problems. After a short outline of hte general technique the nucleon-nucleus optical potential in the doorway approximation (2p-1h and 2h-1p intermediate states) is treated. The imaginary part serves to calculate the energy dependent correction to the real part. The level density parameter, occupation numbers, and the mean free path are discussed. The semiclassical treatment of the nuclear response function is given in detail. Applications to inelastic electron scattering in the quasi-elastic peak region are presented. Analogously, inelastic proton scattering is calculated. Because of the surface absorption this reaction excites the surface response. The imaginary part of the single-particle (hole) potential in the evaluation of the response function introduces a 2p-2h spreading. The missing charge in the longitudinal response is reduced but not all experimental puzzles can be explained. The experience gained in the description of phenomena close to equilibrium serves to construct solutions of the Landau-Vlasov (alias Vlasov-Uehling-Uhlenbeck) equation for the description of non-equilibrium processes encountered in heavy ion reactions.

53650 (LBL–27553) **Multiple electron capture in close ion-atom collisions.** Schlachter, A.S.; Stearns, J.W.; Berkner, K.H.; Bernstein, E.M.; Clark, M.W.; DuBois, R.D.; Graham, W.G.; Morgan, T.J.; Mueller, D.W.; Stockli, M.P.; Tanis, J.A.; Woodland, W.T. Lawrence Berkeley Lab., CA (USA). 24 Jul 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098;AC06-76RL01830. (CONF-890708–9: 16. international conference on the physics of electronic and atomic collisions, New York, NY (USA), 26 Jul - 1 aug 1989). Order Number DE90001541. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Collisions in which a fast highly charged ion passes within the orbit of K electron of a target gas atom are selected by emission of a K x-ray from the projectile or target. Measurement of the projectile charge state after the collision, in coincidence with the K x-ray, allows measurement of the charge-transfer probability during these close collisions. When the projectile velocity is approximately the same as that of target electrons, a large number of electrons can be transferred to the projectile in a single collision. The electron-capture probability is found to be a linear function of the number of vacancies in the projectile L shell for 47-MeV calcium ions in an Ar target. 18 refs., 9 figs.

53651 (N–89-25104) **Charge exchange transition probability for collisions between unlike ions and atoms within the adiabatic approximation.** Xu, Y.J.; Khandelwal, G.S.; Wilson, J.W. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. Apr 1989. 43p. (NASA-TM–101559;NAS–1.15:101559). Available from NTIS, PC A03/MF A01.

A simple formula for the transition probability for electron exchange between unlike ions and atoms is established within the adiabatic approximation by employing the Linear Combination of Atomic Orbitals (LCAO) method. The formula also involves an adiabatic parameter, introduced by Massey, and thus the difficulties arising from the internal energy defect and the adiabatic approximation are avoided. Specific reactions Li(+++) + H to Li(++) + H(+) and Be(4+) + H to Be(3+) + H(+) are considered as examples. The calculated capture cross section results of the present work are compared with the experimental data and with the calculation of other authors over the velocity range of 10(7) cm/sec to 10(8) cm/sec.

53652 (SAND–89-2155C) **Stochastic electron beams in the ion-focussed regime.** O'Brien, K.J. Sandia National Labs., Albuquerque, NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909216–1: DARPA/SDIO service annual charged particle beam review, Monterey, CA (USA), 18-21 Sep 1989). Order Number DE90000807. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In this paper we have studied the stochasticity of the triple-channel configuration. Further studies on the evolution of the ion-hose instability are under way but incomplete at present. 3 refs., 6 figs.

53653 (UCRL–101905) **Path integral simulations of liquid helium.** Pollock, R. Lawrence Livermore National Lab., CA (USA). Aug 1989. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8908106–4: Los Alamos workshop on quantum simulations of condensed matter phenomena, Los Alamos, NM (USA), 8-11 Aug 1989). Order Number DE90001171. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Monte Carlo path integral methods have now been used to reproduce most of the non-dynamic properties of normal and superfluid helium in two and three dimensions in good agreement with experiment. Most of these properties can be related to simple geometric aspects of the paths. The superfluid transition in two and three dimensions will be emphasized. 22 refs., 7 figs.

53654 **Characterization of Al and Al-Cr-Al thin films.** DeLima, O.F. (Argonne Nat. Labs., Argonne, IL); Lepetre, Y.; Brodsky, M.B. pp. 811 of Interfaces, superlattices, and thin films. Dow, J.D.; Schuller, I.K Materials Research Society, Pittsburgh, PA (1987). (CONF-8612131–: Materials Research Society symposium on interfaces, superlattices and thin films, Boston, MA (USA), 1-6 Dec 1986).

TEM, X-ray diffraction, and electrical resistivity measurements were used to study the microstructure and the growth of Al-Cr-Al film sandwiches, where the individual Al layers were 300 A thick and the Cr thickness was varied between 0 - 10 atomic layers. The base vacuum was around 1.0 X 10^{-10} torr, substrate temperatures varied between 100 - 350°C, and evaporation rates were 3 A/s for Al and –0.1 - 0.2 A/s for Cr. All Al films had a strong (111) texture and showed a non-percolative island structure at 350°C. The films became connected at lower substrate temperatures, reaching perfect continuity at 100°C. However, electrical conductivity is achieved also for the films deposited at 350°C when one or more atomic layers of Cr are sandwiched between the Al layers. Results for the superconducting critical temperature and resistivity are discussed in terms of Cr diffusion into Al and the film size effect.

53655 **Exchange of bonded hydrogen in amorphous silicon by deuterium.** Abeles, B. (Brookhaven Nat. Lab., Upton, NY); Yang, L.; Leta, D.P.; Majkrazak, C. pp. 811 of Interfaces, superlattices, and thin films. Dow, J.D.; Schuller, I.K Materials Research Society, Pittsburgh, PA (1987). (CONF-8612131–: Materials Research Society symposium on interfaces, superlattices and thin films, Boston, MA (USA), 1-6 Dec 1986).

The authors show that bonded hydrogen in a-Si:H is readily exchanged by atomic deuterium when exposed to a deuterium plasma discharge. The effective diffusion coefficient for the D, H exchange, 10^{-14} cm^2/sec at 160°C, is comparable to that of interstitial hydrogen in c-Si.

53656 **Observation of a speed-dependent collisional inhomogeneity in H_2 vibrational line profiles.** Farrow, R.L. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94551-0969 (US)); Rahn, L.A.; Sitz, G.O.; Rosasco, G.J. *Physical Review Letters (USA)*, 63(7): 746-749 (14 Aug 1989).

We report observations of inhomogeneous broadening in the vibrational line profiles of a gas in the "impact" density regime. In measurements up to 27 amagat (where the spectra are dominated by collision broadening), non-Lorentzian, asymmetric features are observed in Raman *Q*-branch transitions of H_2 dilute in a heavy perturber gas. We compare these measurements with an inhomogeneous line-profile model based on collisional shifts that strongly depend on the (thermal) speed of the H_2 radiator. Quantitative agreement is obtained only when speed-changing collisions are considered, which result in spectral line narrowing.

53658 (DOE/ER/13839–2) **Comparative study of the vorticity field in turbulent flows: Theory, experiments and computations: Second year progress report.** Hussain, F. Houston Univ., TX (USA). Dept. of Mechanical Engineering. 10 Oct 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER13839. Order Number DE90001399. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The main thrust of our research has been to apply the coherent structures approach to understand, analyze and model turbulent flows. We consider vorticity as the defining property of coherent structures. Turbulent flows are characterized by vortical structures undergoing deformation and interaction due to self- and mutual inductions. One of the primary objectives of our research is to obtain a detailed understanding of these interactions. The concepts of vortex dynamics, when applied to coherent structures, have helped us to understand many of the peculiarities of the noncircular jets, especially elliptic jets. The structures in these jets have nonplanar advections, thus having the simplicity allowing their evolution yet retaining the 3-D features generic of all coherent structures in turbulent shear flows. 16 refs., 6 figs.

53659 (ENEA-RT-FUS–88-27) **Modification of MHD activity by lower hybrid current drive.** Romanelli, F.; Cardinali, A.; Bartiromo, R. ENEA, Frascati (Italy). Centro Ricerche Energia. May 1989. 13p. Order Number DE89793066. Available from NTIS (US Sales Only), PC A03/MF A01.

Submitted to Physics of Fluids.

The effect of magnetic islands on the propagation of lower hybrid waves is analytically investigated for a model slab equilibrium with a single helicity perturbation corresponding to a m=1 or m=2 island. From the variation of k parallel inside the island, the parallel current is estimated with the same pitch of the original perturbation. The effect of such a current on the nonlinear evolution of an m=2 island corresponds to a destabilization of the mode if the RF-driven current is in the same direction of the global parallel current. A comparison with numerical solutions of the problem, by the use of a toroidal ray trajectory code, is also presented.

53660 (UCRL–101907) **Irreversible processes from reversible mechanics.** Hoover, W.G.; Hoover, C.G.; Evans, W.J.; Moran, B.; Levatin, J.A.; Craig, E.A. Lawrence Livermore National Lab., CA (USA). Aug 1989. 76p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8908158–1: Conference on microscopic simulation of complex flows, Brussels (Belgium), 21-25 Aug 1989). Order Number DE90001057. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

We describe and illustrate methods for treating many-body irreversible processes using time-reversible deterministic Nose-Hoover thermostats. In phase space, Lyapunov-unstable multifractal strange attractors are the common feature representing any of these nonequilibrium flows, be they steady, periodic, or transient. This generic behavior is illustrated here for three prototypical one-body problems: steady field-driven diffusive flow in a Galton Board, time-periodic boundary-driven viscous flow of a Lorentz gas, and transient, but time-periodic, compressible flow characterizing a one-dimensional free expansion followed by compression and thermalization. 20 refs., 25 figs.

53661 (UCRL–101976) **Sub-structuring lattice gases.** Elton, B.; Rodrigue, G. Lawrence Livermore National Lab., CA (USA). 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8903169–1: 3. international symposium on domain decomposition, Houston, TX (USA), 20-22 Mar 1989). Order Number DE90001146. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this paper we apply domain decomposition techniques to lattice gases. We demonstrate how a lattice gas can be modeled by a non- linear partial differential equation using the same classical techniques as were used by Chapman and Enskog in approximating the kinetics of a real gas. As an example, we show how a

1-dimensional viscous Burgers' equation models a specific lattice gas. We then use the domain decomposition ideas for solving this differential equation to develop a sub-structuring technique for this exemplary lattice gas. 5 refs., 5 figs.

53662 **Accurate semi-implicit treatment of the Hall effect in magnetohydrodynamic computations.** Harned, D.S. (Science Applications International Corporation, 10260 Campus Point Drive, San Diego, CA 92121 (US)); Mikic, Z. *Journal of Computational Physics (USA),* 83(1): 1-15 (Jul 1989).

A semi-implicit operator is derived for the Hall term that, when implemented in the MHD equations, allows time steps comparable to those normally used in semi-implicit MHD computations. The operator is fourth order in the direction of the magnetic field and is most accurate when used in a split time step algorithm. The effects of the semi-implicit treatment on linear waves in a cylinder are shown both through a detailed analysis and numerical tests. The effectiveness of the algorithm is also demonstrated with a nonlinear computation of a tokamak tearing instability. © 1989 Academic Press, Inc.

53663 **Semi-implicit reduced magnetohydrodynamics.** Kress, M.E. (Courant Institute of Mathematical Sciences, New York University, New York, New York 10012 (US)); Riedel, K.S. *Journal of Computational Physics (USA),* 83(1): 237-239 (Jul 1989).

A modification of the predictor correlator algorithm is applied to the reduced MHD equations. (AIP)

53664 **Method for measuring the stochastic properties of corona and partial-discharge pulses.** Van Brunt, R.J. (National Institute of Standards and Technology, Gaithersburg, Maryland 20899 (US)); Kulkarni, S.V. *Review of Scientific Instruments (USA),* 60(9): 3012-3023 (Sep 1989).

A new method is described for measuring the stochastic behavior of corona and partial-discharge pulses which utilizes a pulse selection and sorting circuit in conjunction with a computer-controlled multichannel analyzer to directly measure various conditional and unconditional pulse-height and pulse-time-separation distributions. From these measured distributions it is possible to determine the degree of correlation between successive discharge pulses. Examples are given of results obtained from measurements on negative, point-to-plane (Trichel-type) corona pulses in a N_2/O_2 gas mixture which clearly demonstrate that the phenomenon is inherently stochastic in the sense that development of a discharge pulse is significantly affected by the amplitude of and time separation from the preceding pulse. It is found, for example, that corona discharge pulse amplitude and time separation from an earlier pulse are not independent random variables. Discussions are given about the limitations of the method, sources of error, and data analysis procedures required to determine self-consistency of the various measured distributions.

53665 **Nonlinear saturation of ballooning modes in tokamaks and stellarators.** Bauer, F. (New York Univ., NY (USA)); Garabedian, P.; Betancourt, O. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(20): 7423-7425 (Oct 1988). DOE Contract FG02-86ER53223.

The spectral code BETAS computes plasma equilibrium in a toroidal magnetic field $B = \nabla s \times \nabla \psi$ with remarkable accuracy because the finite difference scheme employed in the radial direction allows for discontinuities of the flux function ψ across the nested surfaces s = const. Instability of higher modes in stellarators like the Heliotron E can be detected in roughly an hour on the best supercomputers by calculating bifurcated equilibria that are defined over just one field period. The method has been validated by comparing results about nonlinear saturation of ballooning modes in tokamaks with numerical data from the PEST code.

53666 **Statistical effects in the absorption and optical activity of particulate suspensions.** Bustamante, C. (Univ. of New Mexico, Albuquerque (USA)); Maestre, M.R. *Proceedings of the National Academy of Sciences of the United States of America (USA),* 85(22): 8482-8486 (Nov 1988). DOE Contract AC03-76SF00098.

The phenomenon of Duysens flattening of the absorption spectra resulting from the inhomogeneous distribution of the chromophores in the solution is analyzed. These inhomogeneities are treated as localized statistical fluctuations in the concentration of the absorbing species, by using the Gaussian distribution. A law of absorbance is obtained, and the effect of light scattering on the flattening is also characterized. The flattening in the circular dichroism spectra of particulate suspensions is then analyzed. It is shown that the degree of flattening of the circular dichroism of a suspension is, in general, different from the corresponding flattening of its absorption spectrum. A quantitative relationship between the two effects is established.

This report discusses the following tasks: Task B has completed and successfully operated 8 Michigan muon array patches for the UMC experiment. Data from the detector has already improved the limits on the ratio of gamma rays to hadrons in primary cosmic rays. The Task C built luminosity monitor for the Mark II detector is functioning well and fulfilling its key role in the determination of the Z mass and width. Major Task C contributions to the machine diagnostics, the beamstrahlung monitor and wire scanner, have provided critical tuning information for the SLC. Task E has recently reported the detection of 200 GeV γ-rays from the Crab Nebula with a statistical significance of 5.8 σ. This observation confirms the importance of imaging techniques for VHE γ-ray astronomy. The Michigan theory group (Task G) has focused on: Working to understand the systematics of gluon dynamics in poorly understood pseudoscalar meson decays; Exploring the consequences of heavy Higgs boson and/or a top quark more massive than the W^{+-} or Z; Surveying the potentially attractive ways of experimentally searching for the Higgs boson of the minimal Standard Model or the spectrum of Higgs bosons to be expected in extensions of the Standard Model; Calculating the radiative corrections for $W^+W^- \rightarrow W^+W^-$ as a precision test of the Standard Model, especially in its sensitivity to the Higgs sector; Investigating the modifications of general relativity arising from quantum fluctuations of matter; Exploring phenomenological test of CP violation dynamics; Developing relations between the strong CP problem and ElectroWeak CP violation; and Investigating 4-Fermi interactions in Technicolor models.

53668 (DOE/ER/02504–475) **High energy accelerator and colliding beam user group: Progress report, March 1, 1989–February 28, 1990.** Maryland Univ., College Park, MD (USA). Dept. of Physics and Astronomy. Sep 1989. 120p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76ER02504. Order Number DE90001398. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

This report discusses the following topics: OPAL experiment at LEP; Deep inelastic muon interactions at TeV II; Dϕ experiment; Physics with the CLEO detector at CESR; CYGNUS experiment; ν_ee elastic scattering experiment; Further results from JADE; Theory of polarization in electron storage rings; and Rare kaon decay experiments at Brookhaven National Laboratory.

53669 (DOE/FTR–90001701) **[Third workshop on high energy spin physics]: Foreign trip report, September 4, 1989–September 15, 1989.** Ratner, L.G. Brookhaven National Lab., Upton, NY (USA). 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE90001701. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The spin physics workshop presented information on the present status of experiments and outlined an ambitious program to be accomplished in the first five years of UNK operation at fixed target energies of 400 GeV and 3 TeV. In addition, details were given on the status of UNK, including possible collaboration with CERN for a $\bar{p}p$ 3 TeV x 3 TeV collider, and on VLEPP, a 1 TeV x 1 TeV linear electron collider. All of these seem to have the solid commitment of the Soviet Union. Discussions were also held at Dubna on the superferric magnet accelerator under construction, the polarized D_2

source, and the plans of various experimenters to propose D_2 experiments at the AGS.

(UR–1119;CONF-890903–1: International Europhysics conference on high-energy physics, Madrid (Spain), 7-14 Sep 1989). Order Number DE90001134. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We report recent work on the extraction of $R = \sigma_L/\sigma_T$ and the structure function F_2 over a large kinematic range, which is based on a reanalysis of deep inelastic e-p and e-d scattering cross sections measured at SLAC between 1970 and 1985. All these data were corrected for radiative effects using improved versions of external and internal radiative correction procedures. The data from seven individual experiments were normalized to those from the recent high-precision SLAC experiment E140. We find that $R_p = R_d$, as expected in QCD. The value of R is higher than predicted by QCD even when target-mass effects are included. This difference indicates that additional dynamical higher-twist effects may be present. The structure functions F_2p and F_2d were also extracted from the full data sets of normalized cross sections using an empirical fit to R. These structure functions were then compared with data from the CERN muon scattering experiments BCDMS and EMC. We find that our data are consistent with the EMC data, if the latter are multiplied by a normalization factor of 1.07. No single, uniform normalization factor can be applied to the BCDMS data that will bring them into agreement with SLAC data in the region of overlap. 17 refs., 4 figs.

We provide the motivation and update on an experiment being planned at Fermilab to search for an isovector $J^{PC} = 1^{-+}$ meson via the Primakoff effect. 11 refs., 7 figs.

53673 (INIS-mf–12006, pp. 100-103) **Deep-inelastic myon-nucleus-scattering at the CERN SPS.** Alberich, T.; Bird, I.G.; Brueckner, W.; Dierberger, B.; Doebbeling, H.; Dueren, M.; Harrach, D. von; Kabuss, E.M.; Mizuno, Y.; Mueller, A. NMC Collaboration. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Our group is involved in deep inelastic muon nucleon and muon nucleus scattering experiments performed by the NMC collaboration at CERN. The analysis of the data taken in 1986-88 is in progress. Preliminary results for the ratios of the free nucleon structure functions F_2 for proton and neutron, extracted from about 25% of the present data sample, are in good agreement with those from previous muon experiments. Nuclear effects in structure functions have been investigated in 1986-87 with deuterium, helium, lithium, carbon and calcium targets. Below x=0.3 the data have statistical and systematic errors smaller than about one percent. They allow for the first time a detailed study of the EMC effect at small values of x. Preliminary results for $F_2(He)/F_2(D)$, $F_2(C)/F_2(Li)$ and $F_2(Ca)/F_2(Li)$ show that the structure function ratios of heavy to light nuclei are by a few percent bigger than one in the range $x_c<x<0.3$ and smaller than one for $x_c<x$. The value of x_c, where the ratio is equal to one, and of the magnitude of the effect increase with A. In 1988 about 100 million deep inelastic events for carbon and tin have been collected. For these measurements the trigger scheme has been optimized using a special target calorimeter system, which has been built at our institute. (orig.).

53674 (INIS-mf–12006, pp. 108-109) **Proposal for measuring the internal spin structure of proton and neutron.** Bird, I.; Brueckner, W.; Dueren, M.; Gaul, H.G.; Kabuss, E.; Martin, B.; Nowotny, D.; Povh, B.; Rith, K.; Scholz, C. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

We propose to measure the spin dependent structure functions $g_1(x)$ and $g_2(x)$ of proton and neutron using the longitudinally polarized electron beam of the HERA storage ring at DESY and an internal polarized hydrogen and deuterium gas target. (orig.).

53675 (LAPP-EXP–88-12) **Cryogenic detectors: status and prospects.** Gonzalez-Mestres, L.; Perret-Gallix, D. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. 1988. 7p. (CONF-880867–: 24. international Rochester conference on high energy physics, Munich (Germany, F.R.), 4-10 Aug 1988). Order Number DE90713782. Available from NTIS (US Sales Only), PC A02/MF A01.

The present status of cryogenic detector developments for particle physics is discussed, with emphasis on applications at the cross-disciplinary frontier between particle physics and astrophysics, where low temperature devices appear to be particularly well suited. The critical overview of to-date results is completed by a sketch of new ideas and possible ways for further improvements.

53676 (LAPP-EXP–88-19) **Neutrino oscillations at nuclear reactors.** Talby, M. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. 1988. 4p. (CONF-880867–: 24. international Rochester conference on high energy physics, Munich (Germany, F.R.), 4-10 Aug 1988). Order Number DE90713783. Available from NTIS (US Sales Only), PC A02/MF A01.

The status and the prospects of neutrino oscillation at nuclear reactors is reviewed. Neutrino oscillations are the best tool for probing neutrino mass and lepton number non-conservation. Five neutrino oscillation experiments have been carried out since 1981 but did not show any evidence for oscillations. New experiments are prepared by the Bugey group, the Moscow group and the Rovno group. New generations of detectors should play a role to fill the gap betwen present reactor limits and solar neutrino limits.

53677 (LA-UR–89-1304) **Lepton-pair production in hadron-nucleus collisions.** Moss, J.M.; Peng, J.C.; Alde, D.M.; Baer, H.W.; Carey, T.A.; Garvey, G.T.; Klein, A.; Lee, C.; Leitch, M.J.; Lillberg, J.W. Los Alamos National Lab., NM (USA). 1989. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891134–1: INS international symposium on nuclear physics at intermediate energy, Tokyo (Japan), 15-17 Nov 1989). Order Number DE89011175. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Physics motivations for precision measurements of lepton pair production in nuclei are discussed. Preliminary results from Fermilab Experiment E772 are presented. The relevance of these results to the EMC effect and to J/ψ suppression in heavy ion collisions is also discussed. 34 refs., 17 figs.

53678 (LBL–27723) **A search for the electric dipole of the electron.** Abdullah, K.F. Lawrence Berkeley Lab., CA (USA). Aug 1989. 111p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90001572. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

We report a new upper limit on the electric dipole moment (EDM) of the electron of $d_e = 0.1 \pm 3.2 \times 10^{-26}$ e-cm. This precision is one hundred times better than any previously published limit and a factor of two better than that of unofficial reports. Recently there has been a great deal of theoretical interest in the possibility of a non-zero electron EDM. Models such as the left-right-symmetric Standard Model and an "off-standard" model with new heavy neutrinos are constrained by the new limit on d_e. A non-zero electron EDM would violate the time reversal and parity space-time symmetries. T-violation was observed in neutral kaon decay and is still not fully explained by the Standard Model. Our experimental technique involves searching for an energy shift, linear in applied electric field, between the $m_F = 1$ and $m_F = -1$ magnetic sublevels of the F=1 hyperfine level of the $6^2P_{1/2}$ ground state of atomic thallium. If the electron has a non-zero EDM, this thallium state will exhibit an atomic electric dipole moment that is roughly 600 times larger. The energy shift is detected with the technique of magnetic resonance spectroscopy, employing separated oscillating fields, applied to an atomic beam of thallium. In the approach, any relative phase-shift between the $m_F = \pm 1$ components of the F=1 wavefunction acquired by the atom as it travels through an electric field is detected through interference with two separate oscillating magnetic fields located on either side of the electric field. The new level of precision is achieved through several improvements on previous experiments including employment of a vertical apparatus, two opposing atomic beams, and optical pumping for atomic state selection and analysis.

53679 (SLAC-PUB–5000) **CP violation in rare K decays.** Gilman, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905219–1: Conference on CP violation in particle physics and astrophysics, Blois (France), 22-26 May 1989). Order Number DE90000946. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Recent theoretical and experimental progress on CP violation, particularly for rare K decays, is summarized. 36 refs., 6 figs.

53680 (SLAC-PUB–5061) **Status of the tau one prong problem.** Hayes, K.G. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–14: Tau-Charm workshop, Stanford, CA (USA), 23-27 May 1989). Order Number DE90000944. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The present status of the tau one prong problem is reviewed. Emphasis is placed on recent published branching fraction measurements, the status and implications of tau lifetime measurements, and measurements which constrain the sum of branching fractions to be unity. 29 refs., 10 figs., 2 tabs.

53681 (SLAC-PUB–5082) **Color transparency and the structure of the proton in quantum chromodynamics.** Brodsky, S.J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. 88p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8902139–1: Distinguished-speaker colloquium series, Minneapolis, MN (USA), 2 Feb 1989). Order Number DE90000940. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Many anomalies suggest that the proton itself is a much more complex object than suggested by simple non-relativistic quark models. Recent analyses of the proton distribution amplitude using QCD sum rules points to highly-nontrivial proton structure. Solutions to QCD in one-space and one-time dimension suggest that the momentum distributions of non-valence quarks in the hadrons have a non-trivial oscillatory structure. The data seems also to be suggesting that the "intrinsic" bound state structure of the proton has a non-negligible strange and charm quark content, in addition to the "extrinsic" sources of heavy quarks created in the collision itself. As we shall see in this lecture, the apparent discrepancies with experiment are not so much a failure of QCD, but rather symptoms of the complexity and richness of the theory. An important tool for analyzing this complexity is the light-cone Fock state representation of hadron wavefunctions, which provides a consistent but convenient framework for encoding the features of relativistic many-body systems in quantum field theory. 121 refs., 44 figs., 1 tab.

53682 (SLAC-PUB–5087) **Study of Ds decays.** Toki, W.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 6p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00515;AC02-76ER01195;AC03-81ER40050;AC02- (CONF-8905220–1: KEK topical conference on e^+e_- collision physics, Tsukuba (Japan), 17-19 May 1989). Order Number DE90000939. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In the spectator model, the lowest lying bound state of the charm-strange quarks, the Ds meson, is predicted to decay via W emission from the charm quark and form states with $s\bar{s}$ hidden strangeness. The conventional hadronic modes will contain $K\bar{K}$, ϕ and the $f_0(975)$, which is considered to be the $J^{PC} = 0^{++}$ isoscalar $s\bar{s}$ meson. Hadronic decays of the Ds meson have been measured in relatively few modes and all modes are measured relative to the $\phi\pi$ mode. In this paper, an upper limit for the absolute branching ratio of the Ds decay into the $\phi\pi$ mode and evidence for the decay, $Ds \rightarrow f_0(975)\pi$ is presented from the Mark III. 26 refs., 4 figs.

53683 (SLAC-PUB–5093) **Study of Ψ' decays.** Toki, W.H. Mark III Collaboration. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 8p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00515;AC02-76ER01195;AC03-81ER40050;AC02-(CONF-8906204–5: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989). Order Number DE90000936. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Hadronic decays of the ψ' are reviewed and a new preliminary upper limit of $B(\psi \rightarrow \rho\pi) < 7.0 \times 10^{-5}$ at 90% C.L. from the Mark III is presented. 13 refs., 4 figs., 1 tab.

53684 (SLAC-PUB–5094) **Tau Charm Factory physics.** Toki, W.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 12p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract AC03-76SF00515;AC02-76ER01195;AC02-87ER40318. (CONF-8906204–4: International symposium on heavy quark physics, Ithaca, NY (USA), 13-17 Jun 1989). Order Number DE90000935. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Tau Charm Factories proposed for future machines will provide powerful and unique facilities to study a variety of physics topics: the tau lepton, charm mesons, charmonium and the J/ψ decays. These topics cover the physics of the members of the first and second quark doublets and the third lepton doublet. A workshop held at Stanford Linear Accelerator Center reviewed the physics, the machine and the detector for such a facility. In this paper, highlights of this meeting will be reviewed. We will begin with a short sketch of the machine issues and then briefly describe topics in tau, charm and charmonium-J/ψ physics. 49 refs., 2 figs., 1 tab.

53685 **Measurement of the ratio of sea to valence quarks in the nucleon.** Heinrich, J.G. (Enrico Fermi Institute and Department of Physics, The University of Chicago, Chicago, Illinois 60637 (US)); Adolphsen, C.E.; Alexander, J.P.; Anderson, K.J.; Conway, J.S.; Pilcher, J.E.; Possoz, A.; Rosenberg, E.I.; Biino, C.; Greenhalgh, J *Physical Review Letters (USA)*, 63(4): 356-359 (24 Jul 1989). DOE Contract AC02-76ER03072;W-7405-ENG-82.

The ratio of sea to valence quarks for nucleons in tungsten has been measured for the fractional momentum range $0.04 < x_N < 0.36$. The determination is based on the relative production rate of muon pairs by π^+ and π^- beams on a tungsten target. The results provide the most accurate determination to date of this ratio in the region $x_N < 0.1$ and $Q^2 > 20$ GeV^2, and are in good agreement with earlier measurements.

53686 **Initial measurements of Z-boson resonance parameters in e^+e^- annihilation.** Abrams, G.S.; Adolphsen, C.E.; Aleksan, R.; Alexander, J.P.; Allen, M.A.; Atwood, W.B.; Averill, D.;

Ballam, J.; Bambade, P.; Barish, B.C.; and others. *Physical Review Letters (USA)*, 63(7): 724-727 (14 Aug 1989).

We have measured the mass of the Z boson to be 91.11±0.23 GeV/c^2, and its width to be $1.61_{-0.43}{}^{+0.60}$ GeV. If we constrain the visible width to its standard-model value, we find the partial width to invisible decay modes to be 0.62±0.23 GeV, corresponding to 3.8±1.4 neutrino species.

53687 Measurement of the mass and width of the Z^0 boson at the Fermilab Tevatron. Abe, F.; Amidei, D.; Apollinari, G.; Atac, M.; Auchincloss, P.; Baden, A.R.; Bamberger, A.; Barbaro-Galtieri, A.; Barnes, V.E.; Bedeschi, F.; and others. *Physical Review Letters (USA)*, 63(7): 720-723 (14 Aug 1989).

An analysis of $Z^0 \rightarrow e^+e^-$ and $Z^0 \rightarrow \mu^+\mu^-$ data from the Collider Detector at Fermilab in $\bar{p}p$ collisions at $\sqrt{s}$= $1.8 TeV yields a mass of the Z^0$ boson of M_Z=90.9±0.3 (stat+syst)±0.2 (scale) GeV/c^2 and a width of Γ_z=3.8±0.8±1.0 GeV.

53688 (BNL–42381) **Kaon decays: An overview.** Marciano, W.J. Brookhaven National Lab., Upton, NY (USA). Jan 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8811125–6: Rare decay symposium, Vancouver (Canada), 30 Nov - 3 dec 1988). Order Number DE89009532. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A survey of rare and not so rare kaon decays is presented. The role of such decays both in testing the standard model and searching for "new physics" is discussed. 37 refs., 2 tabs.

53689 (BNL–43292) **A theoretical perspective on neutrino physics.** Marciano, W.J. Brookhaven National Lab., Upton, NY (USA). Sep 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8905183–4: Workshop on physics at the main injector, Batavia, IL (USA), 16-18 May 1989). Order Number DE90000759. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A survey of $\sin^2 \theta_W$, ρ, CKM matrix, and axial-isoscalar neutral current measurements via neutrino scattering is presented. Loop effects due to heavy top or a fourth generation are described. Neutrino oscillations are discussed in a three generation mixing framework and some motivation for $\nu_\mu \rightarrow \nu_\tau$ oscillation searches is given. 15 refs., 1 tab.

53690 (CNIC–00211) **Consideration of BRST cohomology in the first quantization of RNS string.** Hu Hongliang; Wang Rong and others. China Nuclear Information Centre, Beijing, BJ (China). May 1988. 6p. Order Number DE90603518. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The differen of Grassmanian even-odd degree even-odd of (super-) conformal ghosts is stressed. With some modifications in the BRST charges and the commutation relations, it can be shown that the first quantization of RNS strings allows the BRST cohomology analysis.

53691 (CNIC–00212) **Gluon condensate contributions in the $\Delta I = 1/2$ rule.** Huang Zheng; Huang Tao. China Nuclear Information Centre, Beijing, BJ (China). Aug 1988. 9p. Order Number DE90603519. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The vacuum background fields method is used to correct the coefficient functions of the 0_+ and 0_- operators in $\Delta S = 1$ effective weak Hamiltonian responsible for K->2π decays. The additional relative octet enhancement factor of 2~3 is obtained by accounting for the gluon condensate correntions if the scale parameter μ^2 is set below 1 GeV^2.

53692 (CNIC–00217) **Charmed meson nonleptonic decays and SU(3) symmetry.** Chen Fengzhi; Wang Ping. China Nuclear Information Centre, Beijing, BJ (China). Jun 1988. 8p. Order Number DE90603520. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Based on the analysis of SU(3) symmetry property, it is pointed that the Cabbibo favored nonleptonic decays of charmed mesons should be treated in two different case: (i) octet-octet final states and (ii) octet-singlet final states. In case (i) the spectator process gives correct predictions, but in case (ii) the decay mechanism is different. A theoretical lower limit of $Br(D_s^+ \rightarrow \omega\pi^+)$ is given which cannot go through spectator process. This channel, as well as $D_s^+ \rightarrow \omega e^+ \nu$ are recommended to search for in experiments.

53693 (CNIC–00219) **Non-leptonic decay of T-mesons.** Chen Fengzhi. China Nuclear Information Centre, Beijing, BJ (China). Jun 1988. 10p. Order Number DE90603521. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Using SU(3) symmetry of u-,d- and s-quarks, the author calculated the decay amplitudes of T-mesons non-leptonic decay and expressed the results in terms of reduced matrix elements.

53694 (DOE/ER/40283–8) **New computational methods for determining antikaon-nucleus bound states.** Fink, P.J. Jr. Oregon State Univ., Corvallis, OR (USA). 24 May 1989. 403p. Sponsored by U.S. DOE Energy Research. DOE Contract FG06-86ER40283. Order Number DE90001695. Available from NTIS, PC A18/MF A01; OSTI; INIS; GPO Dep.

Optical potential for antikaon-nucleus strong interactions are constructed using elementary antikaon-nucleus potentials determined previously. The optical potentials are used to determine the existence of a kaon hypernucleus. Modern three dimensional visualization techniques are used to study model dependences, new methods for speeding the calculation of the optical potential are developed, and previous approximation to avoid full Fermi averaging are eliminated. 19 refs., 21 figs., 3 tabs.

53695 (HD-PY–89/03) **Neutron decay, semileptonic hyperon decay and the Cabibbo model.** Siebert, H.W. Heidelberg Univ. (Germany, F.R.). Physikalisches Inst. 1989. 12p. (CONF-8903138–: ILL workshop on fundamental physics with slow neutrons, Grenoble (France), 8-11 Mar 1989). Order Number DE90711366. Available from NTIS (US Sales Only), PC A03/MF A01.

The decay rates and formfactor ratios of neutron decay and semileptonic hyperon decays are compared in the framework of the Cabibbo model. The results indicate SU(3) symmetry breaking. The Kobayashi-Maskawa matrix element V_{us} determined from these decays is in good agreement with the value determined from K->$\pi e \nu$ decays, and with unitarity of the KM-matrix. (orig.).

53696 (HD-THEP–88-19) **Baryonic sum rules and factorization of four-quark operators.** Jamin, M. Heidelberg Univ. (Germany, F.R.). Inst. fuer Theoretische Physik; Heidelberg Univ. (Germany, F.R.). Naturwissenschaftlich-Mathematische Gesamtfakultaet. Jun 1988. 81p. (In German). Available from Heidelberg Univ. (Germany, F.R.). Inst. fuer Theoretische Physik.

The radiative corrections up to first order in the strong coupling constant for the two-point functions of nucleon and delta are newly calculated. The factorization of the four-quark operators is performed renormalization-group invariantly and from the obtained sum rules the value of the quark condensate is determined. (orig.).

53697 (IFVE-ONF/OTF–88-203) **Problems of superstring-inspired models with right-handed gauge symmetry.** Kereselidze, A.R.; Liparteliani, A.G.; Volkov, G.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1988. 17p. Order Number DE90603581. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Submitted to the journal Intern. J. Mod. Phys. A.

In the present paper the viability of E6 and SO(10) - based superstring inspired models whose gauge symmetry includes $SU(2)_R$ or $U(1)_{T3R}$ factors is considered. The analysis is performed with account for the neutrino mass and proton decay problems as well as for low-energy values of weinberg angle and other phenomenological consequences. 16 refs.; 7 tabs.

53704 (IPNO-TH–88-02) **New UA4 rho ^{a}ntip^p datum and the odderon.** Nicolescu, B. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Jan 1988. 12p. (CONF-8710274–: 2. international conference on elastic and diffractive scattering, New York, NY (USA), 15-18 Oct 1987). Order Number DE90713775. Available from NTIS (US Sales Only), PC A03/MF A01.

We show that the surprising high value of the ratio of the real to the imaginary part of the forward antipp amplitude measured recently at the CERN collider, rho ^{a}ntip^p = 0.24 +- 0.04, can be well described by the presence of the odderon in the crossing-odd amplitude. Several consequences of our interpretation will be testable at Tevatron energies and beyond.

53705 (LAPP-EXP–88-20) **Analysis of the reaction $\pi^-p \to \pi^0$eta n at 100 GeV.** Boutemeur, M.; GAMS-NA12 Collaboration. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. 1988. 8p. (CONF-8808272–: BNL Workshop on Glueballs, Hybrids and Exotic Hadrons, Brookhaven, U (USA), 29 Aug - 1 sep 1988). Order Number DE90713770. Available from NTIS (US Sales Only), PC A02/MF A01.

A partial wave analysis of the π^0eta angular distributions has been performed using three different methods. It clearly indicates the existence of a resonance with exotic quantum numbers: $J^{PC} = 1^{-+}$, $I^G = 1^-$ at $M_{\pi 0 eta} \simeq 1400$ MeV. This is the first observation of a meson that can in no way be a qantiq state. A new peak is also observed in the S wave at $M_{\pi 0 eta} \simeq 1300$ MeV, it could be the regular a_0 member of the $^3P_0$ scalar nonet.

53706 (NBI-HE–89-30) **Topological solitons of the Nambu-Jona-Lasinio model.** Reinhardt, H.; Wuensch, R. Niels Bohr Inst., Copenhagen (Denmark). Jun 1989. 16p. Order Number DE90712108. Available from NTIS (US Sales Only), PC A03/MF A01.

The baryon number one soliton solution of the Nambu-Jona-Lasinio model are found numerically in the mean-field approximation with full inclusion of the Dirac sea using the proper-time regularization for the underlying fermion determinant (quark loop). Explicit breaking of chiral symmetry is included by bare (current) quark masses. The obtained lowest-energy chiral soliton solutions with baryon number one carry winding number one. Fitting the parameters of the model from low-energy pion data the classical energies of these solitons are of the order of the nucleon mass. (orig.).

53707 (PITHA–89/11) **Measuring static quark properties at LEP.** Djouadi, A.; Spira, M. Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst. 1989. 8p. Available from Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst.

The measurement of the hadronic Z branching ratios and jet angular distributions can set stringent limits on static quark properties, radii and anomalous (Z) magnetic moments. For heavy quarks, in particular the third generation, e^+e^- annihilation is the only method to measure these quantities. Bounds on radii of the order 10^{-16} cm down to 10^{-17} cm can be expected from LEP experiments. The radii and magnetic moments can be interrelated in phenomenological models for quark substructures. (orig.).

53708 (PITHA–89/12) **(eb), (et) type leptoquarks at ep colliders.** Djouadi, A.; Spira, M.; Koehler, T.; Tutas, J. Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst. 1989. 16p. Available from Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst.

Leptoquarks with quantum numbers of (eb) and (et) compounds can be generated in electron-gluon collisions. Production rates and signatures are discussed for HERA energies and beyond. (orig.).

53709 (RAL–89-047) **Charm quark contribution to the W and Z cross sections at pp-bar colliders.** Martin, A.D.; Stirling, W.J.; Roberts, R.G. Rutherford Appleton Lab., Chilton (UK). Jun 1989. 15p. (DTP–89-18). Order Number DE90606097. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The ratio R of the cross sections for pp-bar -> W -> $l\nu$ and pp-bar -> Z -> l^+l^- is one of the most important precision measurements at present day pp-bar colliders. In previous studies we have investigated some of the theoretical uncertainties in the calculation of this ratio. We further refine the analysis by considering the uncertainty coming from the charm quark content of the nucleon. We show that data on the charm quark contribution to deep inelastic structure function F_2 are already sufficiently precise to place limits on this uncertainty, and we conclude that the charm quark uncertainty in the ratio of W and Z cross sections does not pose a serious problem. We predict that R = 10.4 +- 0.1 at $\sqrt{s}$ = 1.8 TeV if N_ν = 3 and $m_t > M_W$. (author).

53710 (SLAC-PUB–5088) **Tests of quantum chromodynamics in exclusive e^+e^{minus} and $\gamma\gamma$ processes.** Brodsky, S.J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Sep 1989. 35p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–13: Tau-Charm workshop, Stanford, CA (USA), 23-27 May 1989). Order Number DE90000938. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses the following topics: Factorization theorem for exclusive processes; Electromagnetic form factors of baryons; Suppression of final state interactions; The $\gamma\pi_0$ Transition form factor; Exclusive charmonium decays; The π-ρ puzzle; Time-like compton processes; Multi-hadron production; Heavy Quark exclusive states and form factor zeros in QCD; Exclusive $\gamma\gamma$ reactions; Higher twist effects; and Tauonium and threshold $\tau^+\tau^-$ production. 41 refs., 15 figs. (LSP)

53711 (TRI-PP–89-51) **Present status of CP violation.** Ng, J.N. British Columbia Univ., Vancouver, BC (Canada). TRIUMF Facility. Jun 1989. 7p. (CONF-8905187–4: WEIN '89: international symposium on weak and electromagnetic interactions in nuclei, Montreal (Canada), 15-19 May 1989). Order Number DE90001190. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

A review of the status of CP violation in kaons is given. Status of our knowledge of quark mixing angles in the standard six quark model is presented. The role B_d^0–$\bar{B}_d^0$ transition plays in this study is examined. A comparison of the estimates of CP violation effects from models beyond the standard one is given. Other experiments that have the capability of testing different CP violation models are also discussed. 35 refs., 6 figs., 1 tab.

53712 (TRI-PP–89-52) **Lepton flavor conserving rare pion and kaon decays.** Numao, T. British Columbia Univ., Vancouver, BC (Canada). TRIUMF Facility. Jun 1989. 3p. (CONF-8906160–4: Yamada conference on nuclear weak process and nuclear structure, Osaka (Japan), 12-15 Jun 1989). Order Number DE90001187. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

The standard model of electro-weak interaction has been very successful in explaining every phenomenon in a wide energy region, less than eV to 100 GeV. There seems to be little conflict between the standard model predictions and experimental results. However, it is not expected to be the ultimate theory because the standard model contains so many free parameters to be put in by hand. It doesn't answer the question of the existence of multiple seemingly redundant generations (or flavors) of leptons, either; each lepton generation seems to identically couple to the charged weak bosons (universality) and to have its own quantum number. Experimentally, there are still several unknown parameters in the standard model, such as the top-quark mass and Kobayashi-Maskawa matrix elements. In order to test the standard model further, they should be known or determined more accurately. Rare decays of pions and kaons can provide tight constraints on many unknown parameters. In addition, rare decays are hindered by some mechanism, which usually results on an extreme sensitivity to a certain type of interactions. For instance, the decay $\pi^+ \rightarrow e^+\nu$ is suppressed by helicity effects, which make the decay $\pi^+ \rightarrow e^+\nu$ a sensitive test for a presence of helicity-unsuppressed pseudo-scalar coupling. The standard model prediction could crucially be charged by precise measurements of rare decays of light sources. 8 refs., 3 figs.

53713 (UWThPh–1988-29) **Role of resonances in chiral perturbation theory.** Ecker, G.; Gasser, J.; Pich, A.; Rafael, E. de. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. Sep 1988. 33p. (CERN-TH–5185/88;CPT–88/PE.2158). Order Number DE90603557. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The strong interactions of low-lying meson resonances (spin $\leq$ 1) with the octet of pseudoscalar mesons (π,K,eta) are considered to lowest order in the derivative expansion of chiral SU(3). The resonance contributions to the coupling constants of the $O(p^4)$ effective chiral lagrangian involving pseudoscalar fields only are determined. These low-energy coupling constants are found to be dominated by the resonance contributions. Although we do not treat the vector and axial-vector mesons as gauge bosons of local chiral symmetry, vector meson dominance emerges as a prominent result of our analysis. As a further application of chiral resonance couplings, we calculate the electromagnetic pion mass difference to lowest order in chiral perturbation theory with explicit resonance fields. 29 refs., 2 figs., 5 tabs. (Author).

53714 **Towards an understanding of the generation problem.** Robinson, J.A. Thesis (Ph. D.). 166p. Iowa State Univ., Ames, IA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-05,134.

In this study, Hermitian quark mass matrices for three generations and the Kobayashi-Maskawa mixing matrices which they produce are studied. The investigation is limited to mass matrices which depend on only three parameters. It was found that the Fritzsch mass matrix is the unique matrix consisting of five nonzero elements. Then proceeding to classify physically distinct mass matrices having six or seven nonzero elements, it was found that several produce mixing matrices that are in good agreement with experimental constraints. Next, constraints obtained from the CP violation parameter ε, B^0-$\bar{B}^0$ mixing, and the recent observation of charmless B-decays are imposed. For these matrices values for ε'/ε are calculated and compared to the current experimental limits. It was found that the results from charmless B-decays effectively eliminates the Fritzsch scheme as a realistic three generation model. On the other hand, several of the other mass matrices examined are found to be in good agreement with the most recent experimental and theoretical limits. Finally, the possibility of placing limits on the composite structure of the W boson is examined by looking for form-factor effects as well as a W anomalous magnetic moment (μ_W) in the processes $W \rightarrow e\nu\gamma$, $\gamma e \rightarrow W\nu$, and $\nu \rightarrow W\gamma$. The most sensitive reaction to variation in the magnetic-moment parameter κ_W is $\gamma e \rightarrow W\nu$, which should be accessible at the Stanford Linear Collider and CERN LEP. It was found that all three processes are quite sensitive to form factor effects for a compositeness scale in the range 100 GeV < Λ < 350 GeV. From these reactions future experiments should be able to observe W compositeness from the effects of a nonstandard κ_2, form factors, or both.

53715 **Probing vacuum stability bounds at the Fermilab Collider.** Lindner, M. (Fermi National Accelerator Lab., Batavia, IL (USA)); Sher, M.; Zaglauer, H.W. *Physics Letters [Section] B (Netherlands)*, 228(1): 139-143 (7 Sep 1989).

If the top quark mass is above 86 GeV, then a stringent lower bound on the mass of the Higgs boson arises from the requirement of vacuum stability. We calculate the bound as precisely as possible by numerically solving the renormalization group equations to two-loop order. If the lower bound on the top mass is 100 (110, 120) GeV, the lower bound to the Higgs mass is found to be 20 (34, 50) GeV. Thus, if the standard model is correct, then a nondiscovery of the top quark at the Fermilab Collider implies that the Higgs boson cannot be discovered at CUSB, SLC or LEP I. (orig.).

53716 **Signals of "new physics" in high-energy cosmic-ray interactions.** Domokos, G. (Department of Physics and Astronomy, The Johns Hopkins University, Baltimore, Maryland 21218 (US)); Elliott, B.; Kovesi-Domokos, S.; Mrenna, S. *Physical Review Letters (USA)*, 63(8): 844-847 (21 Aug 1989).

In some composite models of quarks and leptons, leptons are expected to develop strong interactions at high energies. This hypothesis can be tested by studying the absorption of high-energy particles emitted by point sources in the sky on the cosmic microwave background. Data on Cygnus X-3 exhibit an anomaly in the absorption. A plausible interpretation of the anomaly is that some of the interactions are caused by neutrinos. We infer that the cross section of neutrino-nucleon interactions is approximately 6 mb at energies of a few PeV, significantly exceeding the prediction of the standard model.

53717 (CNIC–00213) **Comments on a definition of maximal CP violation.** Zhang Zhiqing; Wu Dandi; Huang Tao. China Nuclear Information Centre, Beijing, BJ (China). Jun 1988. 8p. Order Number DE90603010. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

In the weak basis with diagonalized up quark mass matrix and Hermitian down quark mass matrix, the sequential product of the diagonal elements $M_{1/2}$sup d/$M_2 3^d$ $M_3 1^d$ is a phase convention independent quantity. The idea of using the argument of this product to define maximal CP violation was examined, along with other definitions. The argument in reality is not $\pi/2$ allowing experimental and theoretical uncertainties.

53718 (FNAL/C–89/167-T) **R-parity breaking in low energy supergravity models.** Giudice, G.F. Fermi National Accelerator Lab., Batavia, IL (USA). Aug 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8905223–1: 12. Warsaw symposium on elementary particle physics, Kazimierz (Poland), 29 May - 2 jun 1989). Order Number DE90000780. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The existence of R-parity violating interactions in supersymmetric models leads to various rare processes at low energies, deviations from the standard model predictions on weak interactions and new signals in collider experiments. The present limits on R-violating couplings in the minimal low energy supergravity model are derived. The effects of R-parity violation on the experimental search for supersymmetry are also briefly discussed. 9 refs.

53719 (LAPP-TH–225-88) **Superstring inspired phenomenology.** Binetruy, P. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. 1988. 27p. (CONF-8804184–: 9. workshop on grand unification, Aix-Les-Bains (France), 27-30 Apr 1988). Order Number DE90713784. Available from NTIS (US Sales Only), PC A03/MF A01.

Recent progress in superstring model building is reviewed with an emphasis on the general features of the models obtained. The problems associated with supersymmetry breaking and intermediate gauge symmetry breaking ($M_W < M_I < M_{GUT}$) are described. Finally, the phenomenology of these models is summarized, with a discussion of the role that new experimental results could play to help clearing up the above difficulties.

53720 (NORDITA–89/21-P(prepr.)) **Informal introduction to extended algebras and conformal field theories with $c \geq 1$.** Ravanini, F. Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark). 1989. 51p. (CONF-8904277–: Program on string and conformal field theory, Copenhagen (Denmark), Apr 1989). Order Number DE90712067. Available from NTIS (US Sales Only), PC A04/MF A01.

We review some of the topics of Conformal Field Theory, like extended algebras, parafermions, coset constructions and generalized Feigin-Fuchs construction, modular invariant partition functions on the torus and the help they give in classification of CFTs. Some recent issues in RCFT are also discussed. (orig.).

53721 (RRK–89-12) **Superparticle on the super Riemann surface.** Matsumoto, Shuji; Yasui, Yukinori; Uehara, Shozo. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. Apr 1989. 72p. Order Number DE90710099. Available from NTIS (US Sales Only), PC A04/MF A01.

Free motion of a nonrelativistic superparticle on the super Riemann surface (SRS) of genus $h \geq 2$ is investigated. Geodesics or classical paths are given explicitly on the super Poincare upper half plane SH, a universal covering space of the SRS, and the paths with some suitable initial conditions yield periodic orbits on the SRS. The periodic orbits are unstable and the system is chaotic. Quantum mechanics is solved on the universal covering space SH. And the heat kernel is given on the SRS. This leads a super analog of the Selberg trace formula. The Selberg super zeta function is introduced whose zero-points and poles determine the energy spectrum on the SRS. (author).

53722 **Effect of cascade decays on the Fermilab Tevatron gluino and squark mass bounds.** Baer, H. (Physics Department, Florida State University, Tallahassee, Florida 32306 (US)); Tata, X.; Woodside, J. *Physical Review Letters (USA),* 63(4): 352-355 (24 Jul 1989).

The CDF (Collider Detector Facility) collaboration has recently announced limits on the masses of squarks and gluinos assuming that they decay directly to a massless lightest supersymmetric particle (LSP). We examine how these mass limits change when realistic squark and gluino decays to all gauginos are incorporated and the LSP mass is given by the minimal supergravity model. The gluino mass is diminished by 3–30 GeV as we vary the model parameters over their complete range. The squark mass limit is typically reduced by $\lesssim$10 GeV if m(LSP)$\lesssim$20 GeV.

53723 **Calabi-Yau manifold of four generations.** Rusjan, E. (Center for Transport Theory and Mathematical Physics, Virginia Tech, Blacksburg, Virginia 24061 (YU)); Senjanovic, G.; Sokorac, A. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1166-1175 (15 Aug 1989).

We analyze in detail a recently proposed four-generation superstring model, based on an algebraic variety in $CP_4 \times CP_4$. The group of honest symmetries G_H of the manifold is identified and the transformation properties of the light fields under G_H are given. We also discuss the flux breaking of E_6 symmetry, identify the candidates for matter parity, and analyze supersymmetry breaking. For the Pati-Salam version of the theory we isolate the light fields of the theory and discuss the issues of the naturally light Higgs field(s) and the resulting fermionic mass matrices.

53724 (BiBoS–363/89) **Path integrals over Poisson trajectories: Analytical and numerical estimates of ground state energies.** Bolz, G.F.; Serva, M. Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS). Mar 1989. 10p. (CONF-8807193–: Conference on stochastic processes - geometry and physics, Como (Italy), Jul 1988). Available from Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS).

The aim of this contribution is to demonstrate both a path integral method based on birth and death processes and a related numerical technique by applying them to a simple (but nontrivial) model of an electron in interaction with a boson field mode. (orig.).

53725 (CNIC–00228) **Proton Decay including extra Z^0 bosons.** Li Tiezhong. China Nuclear Information Centre, Beijing, BJ (China). Jun 1988. 7p. Order Number DE90602982. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

There exists an apparent discrepancy between proton decay experiment and simplest SU(5) prediction. Author suggested a scheme: if there exists an extra Z^0 boson then the experimental value of the proton decay may be caluclated from GUT and the good results of SU(5) can be preserved. The increasing fermions will be not bizarre.

53726 (CRN-HE–89-01) **Regularization of the path integral measure for anomalies.** Umezawa, M. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1989. 33p. Order Number DE90713772. Available from NTIS (US Sales Only), PC A03/MF A01.

In this paper we show that the variation of the integral measure is fully equivalent to the authentic field theoretical treatment for a two-point function. To do this we first examine various ways of solving the factor A(x) in Fujikawa's expression for the functional integral measure. We define the anomaly as $A(x)$-A_f (x), where $A_f(x)$ is the Fujikawa factor for the free field. We then propose a regulator which leads to a finite result for any anomaly. We then show that the A(x) can be defined in terms of the proper-time through a splitting procedure. The original Fujikawa prescription for A(x) is shown to be closely related to the proper-time description of the anomaly, initiated by Schwinger. Its equivalence to the authentic field theoretical treatment will be proven as a consequence of these investigations. The ξ-functional regularization for A(x) is also examined. Then we will examine the way to deduce the anomaly from the effective potential by adopting the PHI^4 model as an example. The renormalization group equation for the effective potential is solved exactly to obtain the precise form of the β-function in terms of which we reexpress the result obtained in a previous section for A(x). We discuss the physical significance of the renormalization group equation for the case of broken symmetry.

Northeastern Univ., Boston, MA (USA). Feb 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER40233. Order Number DE90001455. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We report on work done by the principal investigators (Y.N. Srivastava and M.T. Vaughn) and their collaborators on non-scaling phenomena in very high-energy, low p_t physics; vacuum polarization effects in QED and in the standard model for macroscopic systems; and topological (and non-topological) solutions to classical field equations and their computer graphic representations.

53729 (JINR-D–17-88-95, pp. 257-264) **Thermo field dynamics: a quantum field theory at finite temperature.** Mancini, F. (Salerno Univ. (Italy). Ist. di Fisica); Marinaro, M.; Matsumoto, H. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. (CONF-8708341–: 4. international symposium on selected topics in statistical mechanics, Dubna (USSR), 25-29 Aug 1987). In *4. International symposium on selected topics in statistical mechanics*. Order Number DE90705928. Available from NTIS (US Sales Only), PC A09/MF A01 - OSTI; INIS.

A brief review of the theory of thermo field dynamics (TFD) is presented. TFD is introduced and developed by Umezawa and his coworkers at finite temperature. The most significant concept in TFD is that of a thermal vacuum which satisfies some conditions denoted as thermal state conditions. The TFD permits to reformulate theories at finite temperature. There is no need in an additional principle to determine particle distributions at T not = 0. Temperature and other macroscopic parameters are introduced in the definition of the vacuum state. All operator formalisms used in quantum field theory at T=0 are preserved, although the field degrees of freedom are doubled. 8 refs.

53730 (LAPP-TH–237-89) **Finite temperature QCD corrections to lepton-pair formation in a quark-gluon plasma.** Altherr, T. Grenoble-1 Univ., 74 - Annecy; Lab. de Physique des Particules); Aurenche, P. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. Feb 1989. 18p. Order Number DE90713766. Available from NTIS (US Sales Only), PC A03/MF A01.

We discuss the $O(\alpha_S)$ corrections to lepton-pair production in a quark-gluon plasma in equilibrium. The corrections are found to be very small in the domain of interest for ultrarelativistic heavy ions collisions. Interesting effects, however, appear at the annihilation threshold of the thermalized quarks.

53731 (LA-UR–89-3311) **QCD [Quantum Chromo-Dynamics] with dynamical fermions on the connection machine.** Baillie, C.F.; Brickner, R.G.; Gupta, R.; Johnsson, L. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-891149–6: Supercomputing '89 conference, Reno, NV (USA), 13-17 Nov 1989). Order Number DE90001825. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have implemented Quantum Chromo-Dynamics (QCD) on the massively parallel Connection Machine in *Lisp. The code uses dynamical Wilson fermions and the Hybrid Monte Carlo Algorithm (HMCA) to update the lattice. We describe our program and give performance measurements for it. With no tuning or optimization, the code runs at approximately 500 to 1000 MFLOPS on a 64-K Connection Machine, model CM-2, depending on the VP ratio.

53732 (NBI-HE–89-31) **Casimir energy for a piecewise uniform string.** Brevik, I.; Nielsen, H.B. Niels Bohr Inst., Copenhagen (Denmark). Jul 1989. 17p. Order Number DE90712109. Available from NTIS (US Sales Only), PC A03/MF A01.

The Casimir energy for the transverse oscillations of a piecewise uniform closed string is calculated. The string consists of two parts I and II, endowed in general with different tensions and mass densities, although adjusted in such a way that the velocity of sound always equals the velocity of light. The dispersion equation is worked out under general conditions, and the frequency spectrum is determined in special cases. When the ratio L_{II}/L_I between the string lengths is an integer, it is in principle possible to determine the frequency spectrum through solving algebraic equations of increasingly high degree. The Casimir energy relative to the uniform string is in general found to be negative, although in the special case L_I=L_{II} the energy is equal to zero. Delicate points in the regularization procedure are discussed; they point toward an anomaly in the theory. (orig.).

53733 (RRK–89-13) **Abelian gauge theory in topologically non-trivial space.** Hosoya, Akio; Soda, Jiro. Hiroshima Univ., Takehara (Japan). Research Inst. for Theoretical Physics. May 1989. 10p. Order Number DE90710100. Available from NTIS (US Sales Only), PC A02/MF A01.

We quantize the (1+1)-dimensional Abelian gauge theory on cylinder to illustrate our idea how to extract global modes of topological orign. A new analysis is made for the (2+1)-dimensional Maxwell theory on T^2(torus) x R(time). The dynamics is explicitly given for the Wilson loops around cycles of the torus with arbitrary moduli parameters. We also discuss an extension to antisymmetric tensor fields in higher dimensions. (author).

53734 **Hard diffractive processes.** Berger, E.L. (High Energy Physics Div., Argonne National Lab., Argonne, IL (US)); Collins, J.C.; Soper, D.E.; Sterman, G. pp. 657 of Physics simulations at high energy. Barger, V. Gottschalk, T. Halzen, F. World Scientific Pub. Co., Teaneck, NJ (1987).

The authors discuss high energy hadron collisions that contain a hard scattering, in the sense that a W, a Z, very heavy quarks, or high P_T jets are produced, yet are diffractive, in the sense that one of the incident hadrons is scattered with only a small energy loss. In their approach, the cross section for such diffractive hard scattering is a part of the normal hard scattering inclusive cross section, as calculated using perturbative quantum chromodynamics. They use Regge phenomenology in combination with perturbative QCD to estimate that a substantial fraction (perhaps 30%) of all hard scattering events are diffractive. Measurement of diffractive hard scattering cross sections would illuminate the short distance gluon and quark content of the Pomeron.

53735 **Diffractive heavy flavor production-including W^{+-} and Z^0.** White, A.R. (High Energy Physics Div., Argonne National Lab.,

Argonne, IL (US)). pp. 657 of Physics simulations at high energy. Barger, V. Gottschalk, T. Halzen, F. World Scientific Pub. Co., Teaneck, NJ (1987).

It is shown that when the Pomeron has the semiperturbative origin in QCD described in a companion talk, diffractive heavy quark production is independent from, and not suppressed relative to, the perturbative gluon fusion process. It is emphasized that anomalously large diffractive heavy flavor cross-sections could anticipate correspondingly large cross-sections for the diffractive production of W^{+-} and Z^0-providing distinctive evidence for the dynamical nature of the electroweak Higgs sector.

53736 **Ghosts and the *c* theorem.** Mende, P.F. (Department of Mathematics and Center for Theoretical Physics, Laboratory for Nuclear Science and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139 (US)). *Physical Review Letters (USA),* 63(4): 344-347 (24 Jul 1989).

We discuss the central charge in continuous families of two-dimensional conformal field theories. In a nonunitary conformal field theory the *c* theorem does not hold: A critical line can have a continuously varying central charge. This is illustrated with the bosonic-string ghost system and may pose difficulties for attempts to formulate string theory on the space of 2D field theories.

53737 **Aspects of dynamical symmetry breaking in gauge field theories.** Bardeen, W.A. (Fermi National Accelerator Lab., Batavia, IL (USA)); Leung, C.N.; Love, S.T. *Nuclear Physics [Section] B (Netherlands),* 323(3): 493-512 (11 Sep 1989).

The dynamics of chiral and scale symmetry breaking in quenched, planar QED is further examined. Particular attention is focused on the renormalization properties of the model and the relevance of the four-fermion operators. In accordance with our previous results, the scale symmetry is explicitly broken and the dilaton is not found at either strong or weak coupling. An effective lagrangian simultaneously realizing both spontaneously broken scale and chiral symmetries is constructed. (orig.).

53738 **Bosonization of Z_N parafermions.** Griffin, P. (Stanford Linear Accelerator Center, CA (USA)); Nemeschansky, D. *Nuclear Physics [Section] B (Netherlands),* 323(3): 545-571 (11 Sep 1989). DOE Contract AC03-76SF00515;FG03-84ER40168.

We develop a general method of solving non-trivial conformal field theories by coset imbeddings into free boson models. In particular, we consider Z_N parafermion models represented by the coset model constructions $su(N_1) + su(N)_1/su(N)_2$, and bosonize the $su(N)_1$ models. The calculation of correlation functions of these parafermion theories is formulated so that detailed information from the diagonal $su(N)_2$ theory is not required. A differential equation for the four-point function of order operators σ_1 is derived as an example. We also derive differential equations with respect to the modular parameter tau for the parafermion characters in terms of the $su(N)_1$ characters only. In particular, the equations for the Z_2 and Z_3 characters are first and second order respectively. (orig.).

53739 **Interacting Lagrangian for massive spin-two field.** Nappi, C.R. (The Institute for Advanced Study, Princeton, New Jersey 08540 (US)); Witten, L. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1095-1100 (15 Aug 1989).

As is well known, Kaluza-Klein compactification of five-dimensional gravity gives a four-dimensional theory of a tower of massive spin-2 fields interacting with background gravitational, electromagnetic, and scalar fields. Working to lowest order in the massive fields, one can obtain a Lagrangian for a single massive spin-2 field interacting with gravitational and other background fields which is consistent up to terms of higher order in the massive spin-2 field. This consistency depends on massive spin-2 gauge invariances which are valid up to terms of higher order in the massive field. We explicitly exhibit the four-dimensional Lagrangian and its gauge transformations. This analysis parallels a similar analysis in string theory carried out elsewhere.

53740 **Sigma-model duality and duality transformations in string theory.** Molera, J.M. (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396 (US)); Ovrut, B.A. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1146-1149 (15 Aug 1989).

Duality symmetries in the partition functions of closed strings compactified on tori and orbifolds are shown to be a direct consequence of the quantum-level field-theory duality of the associated two-dimensional σ models. This is demonstrated on both genus-0 and genus-1 world sheets.

53741 **Effective field theory from a β function for the *p*-adic string.** Nishino, H. (Department of Physics and Astronomy, University of North Carolina, Chapel Hill, North Carolina 27599-3255 (US)); Okada, Y.; Ubriaco, M.R. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1153-1165 (15 Aug 1989).

We describe the calculation of a β function for the *p*-adic string σ model in a tachyonic background, and show that the vanishing condition of the β function reproduces the tachyonic field equation obtained from *p*-adic amplitude calculations, up to the fifth order in the tachyonic field. By examining this σ model in the presence of a soliton background, we show that a previously obtained soliton solution of the all-order tachyonic field equation follows from the requirement of discrete scale invariance.

53742 **Effective one-loop Lagrangian for nonlinear σ models coupled to gravity.** Jain, V. (Department of Physics, University of California and Theoretical Physics Group, Physics Division, Lawrence Berkeley Laboratory, 1 Cyclotron Road, Berkeley, California 94720 (US)). *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1213-1220 (15 Aug 1989). DOE Contract AC03-76SF00098.

A simple application of covariant-derivative expansion techniques to compute the divergent one-loop contributions to the effective action for a nonlinear σ model coupled to gravity is presented. The results are then applied to a class of superstring-inspired supergravity models.

53743 **Wilson loops in three dimensions.** Cahill, K. (Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02138, Division de Physique Theorique, Institut de Physique Nucleaire, Universite de Paris-Sud, 91406 Orsay, France (US)); Prasad, S. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1274-1292 (15 Aug 1989).

For a pure gauge theory in three dimensions with a compact, semisimple gauge group, we derive a formula for Creutz ratios of Wilson loops that is valid in the continuum theory to fourth order in the coupling constant. For $SU(2)_3$, we compare this perturbative formula, corrected for periodic boundary conditions, with lattice Creutz ratios that we have measured both in compact simulations guided by Wilson's or Manton's action and in noncompact simulations guided by the Yang-Mills action. The noncompact simulations show no evidence of quark confinement. We also present a critique of compact lattice methods and discuss the renormalization of both compact and noncompact simulations.

53744 **The δ expansion and local gauge invariance.** Bender, C.M. (Department of Physics, Washington University, St. Louis, Missouri 63130 (US)); Cooper, F.; Milton, K.A. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1354-1355 (15 Aug 1989).

A recently proposed approximation method, called the δ expansion, was introduced in the context of a self-interacting scalar field theory. This approximation method offers the hope of obtaining nonperturbative information about a quantum field theory using perturbative techniques. In this paper we extend formally the δ-expansion methods to field theories having local gauge symmetry. We then compute the anomaly in the Schwinger model.

53745 (CONF-890826–4) **Heavy Ion interactions.** Schiffer, J.P. Argonne National Lab., IL (USA). [1989]. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International nuclear physics conference; Sao Paulo (Brazil); 20-26 Aug 1989. Order Number DE90001410. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Nuclear Physics has come a long way since its inception 70 years ago. We have learned a great deal about nuclear structure and nuclear interactions – and we have a lot to learn yet. Our understanding of the substructure of protons and neutrons in terms of their 'elementary' constituents has also evolved to the present level of QCD and the Standard Model. Early work on nuclear reactions involving light projectiles did a great deal in elucidating the characteristic nuclear symmetries and the dynamic phenomena associated with nuclei. As accelerator and ion source technologies evolve it has become possible to accelerate heavier nuclei in addition to electrons, protons, and the very light nuclear systems. From these developments in the tools of our science we are deriving new knowledge: learning about otherwise inaccessible nuclear properties, of the dynamic characteristics of nuclear matter, and about the production of mesons, antiparticles, and other exotic objects in the collision of complex nuclear systems. The subject cuts across much of nuclear physics and it is difficult to give a cohesive overview talk. But I would like to attempt giving you the current flavors of the subject. 18 figs.

53746 (DOE/ER/40145–4) **Research in theoretical nuclear physics: Progress report, November 1, 1988–October 31, 1989.** Texas Univ., Austin, TX (USA). Dept. of Physics. Oct 1989. 54p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-84ER40145. Order Number DE90001402. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report discusses the following topics in nuclear physics: reactions induced by light ions; reactions induced by heavy ions; medium energy physics; and nuclear collective motions. (LSP)

53747 (DOE/ER/40269–T2) **[Intermediate energy nuclear physics]: Progress report, October 1, 1988–October 1, 1989.** Colorado Univ., Boulder, CO (USA). 1 Oct 1989. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER40269. (NPL–1056). Order Number DE90001944. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

This report summarizes work in experimental Intermediate Energy Nuclear Physics carried out between October 1, 1988 and October 1, 1989 at the Nuclear Physics Laboratory of the University of Colorado, Boulder, under grant DE-FG02-86ER-40269 with the United States Department of Energy. The experimental program is very broadly based, including pion-nucleon studies at TRIUMF, inelastic pion scattering and charge exchange reactions at LAMPF, and nucleon charge exchange at LAMPF/WNR. In addition, a number of other topics related to accelerator physics are described in this report.

53748 (DOE/ER/40285–3) **A program in medium-energy nuclear physics: Technical progress report, August 1988–September 1989.** Berman, B.L.; Dhuga, K.S. George Washington Univ., Washington, DC (USA). 1989. 35p. Sponsored by U.S. DOE Energy Research; National Science Foundation. DOE Contract FG05-86ER40285. Order Number DE90001233. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This report discusses research done on the following topics: electron-scattering nuclear-structure studies; coincidence electrodisintegration studies of light nuclei; pion scattering and reactions on the three-body nuclei; and pion scattering from shell-model nuclei.

53749 (DOE/ER/40343–3) **Research in experimental nuclear physics: Progress report, April 1, 1987–March 31, 1990.** Moore, C.F. Texas Univ., Austin, TX (USA). Dept. of Physics. Sep 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER40343. Order Number DE90001401. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Our program concentrates on pion physics experimental results obtained using the Energetic Pion Channel and Spectrometer (EPICS), Pion and Particle Physics channel (P^3), and the Low Energy Pion physics channel (LEP). These facilities are unique in the world in their intensity and resolution. Two classes of experiments can be done best with this equipment: scattering (elastic and inelastic) and double charge exchange (DCX). Several coincidence experiments are in progress and are discussed in this paper.

53750 (INIS-BR–1662) **Hyperfine interaction studies with heavy ion beams: applications in nuclear physics.** Saxena, R.N. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). 1986. 17p. Order Number DE90606110. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Heavy ion reactions using pulsed beam had a great influence on the study of hyperfine interactions. Until recently the radioactivity or light-ion reactions have been used for such studies. Heavy-ion reactions however offer considerable advantage for systematic investigation of hyperfine interactions. In this review we shall describe the basic technique of time differential perturbed angular distribution (TDPAD) and recent applications to some problems in nuclear physics such as the measurements of nuclear magnetic and electric quadrupole moments of high spin isomers. (author).

53751 (INIS-mf–12006) **Max-Planck-Institute for Nuclear Physics. Annual report 1988.** Klapdor, H.V. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). Abt. fuer Kernphysik); Jessberger, E.K. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). Abt. fuer Kosmophysik) (eds.). Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. 200p. (In German). Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

This annual report contains short notes and abstracts about the work performed at the named institute together with a list of publications and talks. The work concerns technical developments of accelerators and ion sources, experimental and theoretical studies on nuclear structure and reactions, high-energy physics, studies on meteorites and lunar rocks, comets, interplanetary and interstellar dust, interstellar dynamics, nuclear geology, and archaeometry. See hints under the relevant topics. (HSI).

53752 (ISN–88-74) **Nuclear viscosity.** Suraud, E.; Gregoire, C. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. 1988. 37p. (In French). Order Number DE90713790. Available from NTIS (US Sales Only), PC A03/MF A01.

Heavy ion collisions permit to study the effects of nuclear viscosity, which represent the global consequence of the multiple nucleon-nucleon interactions during a collision. But the characteristic timelength of these phenomena is 10^{-22} s while the detectors precision hardly reach 10^{-9} s. It is therefore necessary to use a theoretical simulation. Only recently, a semi-classical approximation showed the nuclear-viscosity phenomenon. This approximation is represented by the Landau-Vlasov equation. Convenient solutions have recently be found. Less precise on the quantic point of view than the Hartree-Fock equation precedently used, Landau-Vlasov equation permits to study viscosity in nuclei, which is quite essential for the comprehension of two of the four fundamental interactions of nature.

53753 (ISN–89-15) **Charged pion ratio in heavy ion reactions at 93 MeV/u.** Lebrun, D.; Chauvin, J.; Rebreyend, D.; Perrin, G.; Saintignon, P. de; Martin, P.; Buenerd, M.; Le Brun, C.; Lecolley, J.F.; Cassagnou, Y. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. 1989. 11p. (CONF-8901120–: 27. international winter meeting on nuclear physics, Bormio (Italy), 23-27 Jan 1989). Order Number DE90713779. Available from NTIS (US Sales Only), PC A03/MF A01.

In heavy ion reaction, very low momentum pions can be a tool to study the space time geometry of the collision. Those pions suffer a strong electromagnetic interaction which is very sensitive to the shape of nuclear charge distribution after the collision took place. These coulomb distortions experimentally manifest as singularities in the pion momentum distributions for p-values matching those of nuclear products. Such distributions of very low energy charged pions were measured at low transverse momenta (zero degree), in production reactions induced by a 93 MeV/u oxygen beam from GANIL on various targets. For pion velocity close to the beam and below, very strong effects are seen in the ratio (N-/N+); values up to 100 are archived. Two main contributions can explain it. One comes from the fragmentation region which dominates in low mass systems. The other, whose influence increases drastrically with mass, is characterized by an intermediate size and velocity system. The dependence of the pion yield upon its size indicates this system is the source of pions.

53754 (JINR-E–3-89-506) **Nuclear structure and decay of compound states.** Popov, Yu.P. Joint Inst. for Nuclear Research,

Dubna (USSR). [1989]. 10p. (CONF-8906168–5: International conference on selected topics in nuclear structure, Dubna (USSR), 20-24 Jun 1989). Order Number DE90000716. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI.

The experimental data on the formation and decay of states at the neutron binding energy and below it (compound and pre-compound states), that were acquired in the last years, are considered to inquire into the nature (structure) of high excited states as well as of the processes of fragmentation of considerably simple excitation modes over compound states. An essential role of single particle excitations of compound and pre-compound states in the process of γ-decay of neutron resonances of heavy nuclei in the vicinity of a 4S-shell is indicated. 17 refs., 7 figs., 1 tab.

53755 (ORNL/FTR–3392) **[Evolution of nuclear collectivity at high spins and temperatures]: Foreign trip report, August 29, 1989–September 17, 1989.** Baktash, C. Oak Ridge National Lab., TN (USA). 28 Sep 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001251. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended and presented an invited talk entitled "Evolution of nuclear collectivity at high spins and temperatures" at the XII Workshop on Nuclear Physics at Iguazu Falls, Argentina. Following the conference, the traveler visited the TANDAR Laboratory in Buenos Aires, Argentina, for two weeks. This trip was the first by one of the principal investigators of an ORNL-TANDAR exchange program that was recently approved and funded by the NSF. The results of the extensive consultations that the traveler had with his Argentine collaborators, A. J. Kreiner and G. Garcia-Bermudez, can be summarized as follows: (1) discussed the spectroscopy work on several nuclei of common interest that are being studied at the two laboratories, (2) agreed on the first joint experiments to be performed at the Holifield and TANDAR facilities, (3) developed a tentative timetable for the future visits by both groups, and (4) continued with the analysis of data on ^{82}Sr taken earlier at ORNL in collaboration with Dr. Garcia-Bermudez.

53756 (ORNL/FTR–3399) **[The 1989 International Nuclear Physics Conference]: Foreign trip report, August 17, 1989–September 10, 1989.** Obenshain, F.E.; Plasil, F. Oak Ridge National Lab., TN (USA). 6 Oct 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001243. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The travelers attended the 1989 International Nuclear Physics Conference in Sao Paulo, Brazil, and the International Workshop on Relativistic Aspects of Nuclear Physics in Rio de Janeiro. They presented talks and posters covering various aspects of the WA80 experiment at both meetings.

53757 (TRI-PP–89-65) **Gamow Teller strength from charge exchange reactions at intermediate energies.** Haeusser, O. Simon Fraser Univ., Burnaby, BC (Canada). Jul 1989. 3p. (CONF-8906160–6: Yamada conference on nuclear weak process and nuclear structure, Osaka (Japan), 12-15 Jun 1989). Order Number DE90001188. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

Detailed studies of the spin-isospin structure of nuclear excitations are possible at TRIUMF's medium resolution spectrometer using the (n,p), $(\vec{p},\vec{p}\,')$ and (p,n) reactions. We discuss here results on isospin symmetry of inelastic nucleon scattering reactions populating isospin triads in A=6 and A=12 nuclei. The β^+ Gamow Teller strength function from (n,p) reactions on (sd) and (fp) shell targets is found to be substantially quenched compared to current nuclear structure models using the free-nucleon axial-vector coupling constant. 22 refs., 3 figs.

53758 (TRI-PP–89-69) **Gamow-Teller strength from N-nucleus scattering.** Haeusser, O. British Columbia Univ., Vancouver, BC (Canada). TRIUMF Facility. Aug 1989. 5p. (CONF-8906168–4: International conference on selected topics in nuclear structure, Dubna (USSR), 20-24 Jun 1989). Order Number DE90001189. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

Detailed studies of the spin-isospin structure of nuclear excitations are possible at TRIUMF's medium resolution spectrometer using the (n, p),$(\vec{p},\vec{p}\,')$ and (p,n) reactions. We discuss here results on isospin symmetry of inelastic nucleon scattering reactions populating isospin triads in A=6 and A=12 nuclei. The empirical ratio of L=0 isovector spinflip cross sections at 200-450 MeV and B(GT) for strong Gamow-Teller transitions in p-shell nuclei is found to be larger than calculated in the DWIA using a free NN t-matrix. Based on empirical values of σ/B(GT) the β^+ Gamow-Teller strength function from (n,p) reactions on (sd) and (fp) shell targets is substantially quenched compared to current nuclear structure models using the free-nucleon axial-vector coupling constant. 33 refs., 6 figs.

53759 (INIS-mf–12006, pp. 48-50) **^{4}He(e,e'x) coincidence experiments for investigation of charge symmetry in ^{4}He.** Khan, S. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Kihm, T.; Knoepfle, K.T.; Schulz, H.J.; Spahn, M.; Friedrich, J.; Voegler, N.; Schmitt, C.; Walther, V.H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

^{4}He(e,e'c) coincidence electron scattering at low momentum transfer allows us to study for the first time simultaneously the p and n decay from the giant resonance region in ^{4}He below ω=30 MeV by detecting the charged particles c=p, ^{3}H and ^{3}He in the same detector systems. Careful data analysis yields the ratio $R_e=\sigma[^4He(e,e'p)]/\sigma[^4He(e,e'n)]$ in the excitation energy region $22<\omega<36$ MeV. (orig./HSI).

53760 (INIS-mf–12006, pp. 50-51) **The interference term between nuclear charge and nuclear current matrix elements of the E1 giant resonance in ^{12}C and ^{58}Ni.** Kihm, T. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Khan, S.; Knoepfle, K.T.; Schulz, H.J.; Spahn, M.; Emrich, H.J. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Via the (e,e'p) reaction the longitudinal-transverse interference term of the nuclear response function has been measured in the giant dipole resonance region of ^{12}C and ^{58}Ni by exploiting its explicit $\cos\phi_p$ dependence; ϕ_p is the azimuthal emission angle of the proton with respect to the axis of momentum transfer. (orig.).

53761 (TRI-PP–89-54) **Radiative muon capture in light nuclei.** Hasinoff, M.D.; Ahmad, S; Armstrong, D.S.; Azuelos, G.; Bertl, W.; Blecher, M.; Burnham, R.A.; Clifford, E.T.H.; Chen, C.Q.; Ding, Z.H.; Depommier, P.; Gorringe, T.P.; Henderson, R.; Larabee, A.J.; Macdonald, J.A.; Mes, H.; Numao, T.; Poutissou, J.M.; PoutBritish Columbia Univ., Vancouver, BC (Canada). TRIUMF Facility. Jun 1989. 3p. (CONF-8906160–5: Yamada conference on nuclear weak process and nuclear structure, Osaka (Japan), 12-15 Jun 1989). Order Number DE90001186. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

Radiative muon capture rates have been measured for carbon, oxygen and calcium targets. The carbon and oxygen rates yield large values for g_p when compared to detailed microscopic calculations but the conventional Goldberger-Treiman value when compared to phenomenological model calculations. A progress report on the TRIUMF RMC measurement on hydrogen is also given. 16 refs., 2 figs., 1 tab.

53762 **Proton propagation in nuclei studied in the *A* dependence of the (e,e'p) reaction in the quasifree region.** Geesaman,

D.F.; Gilman, R.; Green, M.C.; Holt, R.J.; Schiffer, J.P.; Zeidman, B.; Garino, G.; Saber, M.; Segel, R.E.; Beise, E.J.; and others. *Physical Review Letters (USA)*, 63(7): 734-737 (14 Aug 1989).

The *A* dependence of the $(e,e'p)$ reaction in the quasifree region has been measured at an average Q^2 of 0.33 $(GeV/c)^2$ for targets of ^{12}C, ^{27}Al, ^{58}Ni, and ^{181}Ta. The outgoing proton kinetic energy was 180±30 MeV. By comparing the ratio of $(e,e'p)$ coincidence to (e,e') singles yields, average proton transmissions are obtained for each target. The resulting "mean free path" or, more precisely, the attenuation length for protons in the nucleus is significantly longer than expectations based on the free nucleon-nucleon cross section.

53763 $^{12}C(\pi^{\pm},\pi^{\pm\prime}p)^{11}B$ reaction near the giant dipole region. Yoo, S.H. (University of Texas at Austin, Austin, Texas 78712-1081 (US)); Williams, A.; Mordechai, S.; Moore, C.F.; Morris, C.L.; Seestrom-Morris, S.J.; Jones, M.K.; Sterbenz, S.M.; Dehnhard, D.; Oakley, D.S.; and others. *Physical Review Letters (USA)*, 63(7): 738-741 (14 Aug 1989).

Cross sections for the $^{12}C(\pi^{\pm},\pi^{\pm\prime}p)^{11}B$ reaction have been measured and compared with the results of distorted-wave impulse-approximation calculations that employ the vactirozation approximation for quasifree scattering. Near the giant dipole resonance of ^{12}C the calculations underestimate the cross sections for $(\pi^-,\pi^{-\prime}p)$. The angular distributions for $(\pi^+,\pi^{+\prime}p)$ and $(\pi^-,\pi^{-\prime}p)$ are different and indicate that in this region there is interference between direct decay and semidirect decay.

53764 Properties of the giant dipole resonance built on the isobaric analog state. Mordechai, S. (Ben-Gurion University of the Negev, Beer-Sheva 84105, Israel (IL)); Auerbach, N.; Greene, S.; Morris, C.L.; O'Donnell, J.M.; Fortune, H.T.; Liu, G.; Burlein, M.; Wuosmaa, A.; Yoo, S.H.; and others. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 850-858 (Aug 1989).

Resonances were observed in pion-induced double charge exchange (at T_π=292 MeV) on ^{13}C, ^{59}Co, ^{93}Nb, ^{138}Ba, and ^{197}Au in the continuum at excitation energies of 8.4, 27.5, 33.2, 38.7, and 44.2 MeV, respectively (Q=−27.4, −32.3, −35.8, −38.4, and −46.0 MeV). An angular distribution was measured for the resonance on ^{93}Nb and observed to have a dipole shape. The measured cross sections and the angular distribution agree well with a simple sequential two-step calculation in which the intermediate states arise from single charge exchange to the isobaric analog state and to the giant dipole resonance. Based on their excitation energies, angular distribution for ^{93}Nb, and cross sections we identify the resonances as the giant dipoles built on the isobaric analog states. The new data together with the recent observation of the resonance in three other nuclei indicate that the excitation energies, widths, and cross sections for these resonances have a simple mass dependence.

53765 (INIS-mf–12006, pp. 73-74) **Spin and parity assignments to excited ^{37}Cl states.** Khan, S.; Kihm, T.; Knoepfle, K.T.; Mairle, G.; Reinhardt, H.; Seeger, M. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988*. Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The $^{38}Ar(d,^3He)^{37}Cl$ reaction has been studied with polarized deuterons at 52 MeV incident energy. Spins and parities of excited ^{37}Cl states have been deduced from the measured angular distributions of differential cross sections and analyzing powers. (orig.).

53766 (INIS-mf–12006, pp. 78-80) **Polarized $^{6,7}Li$ scattering from ^{26}Mg at 44 MeV.** Rusek, K. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Moroz, Z.; Ott, W.; Steffens, E.; Turkiewicz, I.M.; Vogt, H.; Becker, K.; Blatt, K.; Gerlach, A.; Korsch, W. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. In *Max-Planck-Institute for Nuclear Physics. Annual report 1988*. Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Elastic and inelastic scattering of polarized ^6Li from ^{26}Mg was measured. Coupled-channel calculations using cluster-folding potentials were performed. The method of coupled-channel was also used to study the mechanism of elastic and inelastic scattering of polarized ^7Li ions from the same target nucleus. (orig.).

53767 Inclusive production of K^+ mesons in 2.1-GeV/nucleon nuclear collisions. Schnetzer, S. (Nuclear Science Division, Lawrence Berkeley Laboratory, University of California, Berkeley, Berkeley, California 94720 (US)); Lombard, R.M.; Lemaire, M.; Moeller, E.; Nagamiya, S.; Shapiro, G.; Steiner, H.; Tanihata, I. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 640-653 (Aug 1989). DOE Contract AC03-76SF00098.

K^+ meson production by 2.1-GeV/nucleon Ne, *d*, and *p* projectiles on NaF and Pb targets has been measured. The cross sections depend exponentially upon the kaon energy in the nucleon-nucleon c.m. frame, with an inverse slope T_0 larger than the values obtained from comparable proton and π^- spectra. The angular distribution in this frame is approximately isotropic. The *A* dependence of the kaon yield has been determined. Data are compared with theoretical predictions.

53768 Pion inelastic scattering to the low-lying broad 2^+ in ^{20}Ne. Burlein, M. (University of Pennsylvania, Philadelphia, Pennsylvania 19104 (US)); Fortune, H.T.; Amos, W.M.; Ekenberg, T.L.; Kotwal, A.; Kutt, P.H.; O'Donnell, J.M.; Silk, J.D.; Boyer, B.; Fuentes, A.; and others. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 785-789 (Aug 1989).

We have observed the broad 2^+ member of the $K^\pi=0_4^+$ band of ^{20}Ne with the $^{20}Ne(\pi^+,\pi^{+\prime})$ reaction at T_π=120 and 180 MeV and with $^{20}Ne(\pi^-,\pi^{-\prime})$ at T_π=180 MeV. We find an excitation energy of 9.00±0.18 MeV and a width of 0.8 MeV. The $B(E2\uparrow)$ is determined to be approximately 25 to 35 e^2fm^4.

In this paper the time dependence of the coherent decay of nuclear excited state in an α-$^{57}Fe_2O_3$ single crystal is presented. The experiment was carried out in diffraction geometry. A highly monocromatized and collimated beam of synchrotron radiation was used for the excitation of nuclear levels. Quantum beat spectra taken below and above the (7,7,7) pure nuclear reflection of hematite show a characteristic pattern corresponding to the magnetic and quadrupole hyperfine interactions. 16 refs., 1 fig.

53772 Isospin asymmetries in pion scattering to isoscalar giant quadrupole states in Ni isotopes. Oakley, D.S. (University of Colorado, Boulder, Colorado 80309 (US)); Braunstein, M.R.; Kraushaar, J.J.; Loveman, R.A.; Peterson, R.J.; Rilett, D.J.; Boudrie, R.L. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 859-864 (Aug 1989).

Inelastic scattering of 180 MeV π^- and π^+ from ^{58,60,62,64}Ni shows a prominent quadrupole feature near $65A^{-1/3}$ MeV, identified as the familiar isoscalar giant quadrupole resonance. For the heavier two isotopes, the π^- scattering cross sections greatly exceed those for π^+, the same effect previously noted in pion scattering on heavy nuclei. Since these four nickel targets contain a range of single-nucleon binding energies, these new data demonstrate the influence of these single-particle effects on the apparent isospin response, increasingly neutronlike for the heavier isotopes.

Available from NTIS (US Sales Only), PC A09/MF A01.

The investigation of correlations between identical particles evaporated from the deexcitation cascade of a compound nucleus offers the possibility to determine its lifetime. We measured nn-correlations in the system ^{18}O+^{64}Ni at 96 MeV bombarding energy. Fermions are expected to diminish the coincidence cross-section at small relative momenta due to the quantum statistical interference effect. The comparison of energy difference spectra at small and large relative angles shows, as expected, a reduction in the former case around ΔE=0. (orig.).

53775 Structure of odd-odd ^{74}Ga from the decay of neutron-rich ^{74}Zn. Winger, J.A. (Ames Laboratory, Iowa State University, Ames, Iowa 50011 (US)); Hill, J.C.; Wohn, F.K.; Brenner, D.S. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 1061-1064 (Aug 1989). DOE Contract W-7405-ENG-82.

A decay scheme of ^{74}Zn to levels in ^{74}Ga is presented in which 39 γ rays are placed, deexciting 11 states up to 1085 keV. Five levels are postulated to have J^π=1$^+$ based on β feedings but much uncertainty still exists concerning J^π assignments for levels below 300 keV.

The decay of highly excited Dy-compound nuclei has been studied with the Darmstadt-Heidelberg crystal ball spectrometer in the reaction ^{124}Sn(^{34}S,xn)$^{158-xn}$Dy at E_{lab}=150 MeV (E^*=69.2 MeV). The crystal ball was supplemented by four anti-Compton shielded germanium detectors and data were taken in coincidence with a newly developed annular parallel plate avalanche detector at extreme forward angles to identify the evaporation residues. The aim of the measurement was mainly to study the region of the 'statistical' γ-rays (E_γ=2-7 MeV), where earlier studies revealed significant discrepancies between the experimental data and model calculations within the framework of the Statistical Model. (orig.).

53778 (INIS-mf–12006, pp. 75-76) **Study of nuclear fragmentation in symmetric systems.** Pelte, D.; Gnirs, M. GSI-GANIL-Florence Collaboration. The cross sections for m_F=3,4,5 heavy fragment channels in the symmetric ^{100}Mo+^{100}Mo and ^{120}Sn+^{120}Sn reactions were measured at energies around 20 MeV/A. The energy and directional distributions of light evaporation products were analyzed in order to determine the contribution of different mechanisms to these reaction channels. (orig.).

53779 (IPEN-PUB–251) **Directional correlations of γ-transitions in ^{142}Ce.** Lapolli, A.L.; Zamboni, C.B.; Saxena, R.N. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Apr 1989. 23p. Order Number DE90606117. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Angular correlations of coincident gamma transitions have been measured in ^{142}Ce following the β^- decay of fission product ^{142}La ($T_{1/2}$ = 93 min) using a spectrometer consisting of a HPGe and a Ge(Li) detector. The measurements have been made on 14 direct and 13 skip cascades. Spin assignments were made to the levels at 2181 KeV (3+), 2727 KeV (1+), 3612 KeV (2+) and 4043 KeV (2+). In addition several previous spin assignments to other levels were confirmed. The multipole mixing ratios δ for 23 transitions were determined from the present results. (author).

53780 Nuclear data sheets for A=139. Burrows, T.W. (National Nuclear Data Center, Brookhaven National Laboratory, Upton, NY 11973 (US)). *Nuclear Data Sheets (USA)*, 57(3): 337-437 (Jul 1989). DOE Contract AC02-76CH00016.

The 1981 evaluation of A=139 (81Pe04) has been revised using experimental decay and reaction data received by April 17, 1989.

53781 Level structure of the odd mass Pr isotopes: Levels of ^{143}Pr$_{84}$ populated in the beta decay of ^{143}Ce. Kusnezov, D.F. (National Superconducting Cyclotron Laboratory, Department of Physics Astronomy, Michigan State University, East Lansing, Michigan 48824 (US)); Nethaway, D.R.; Meyer, R.A. *Physical Review*

[Section] C: Nuclear Physics (USA), 40(2): 924-931 (Aug 1989). DOE Contract W-7405-ENG-48.

We have studied the levels of ^{143}Pr populated in the beta decay of ^{143}Ce using singles and Compton suppression gamma-ray spectroscopy techniques. We determined a value of 33.10±0.05 h for the half-life of ^{143}Ce. In contrast to previous studies, we find no evidence for low-energy negative-parity levels in the decay of ^{143}Ce to ^{143}Pr. In addition we have performed calculations in the framework of the interacting boson-fermion model, which compare well with the level structure of ^{143}Pr. These calculations have been extended to the heavier Pr isotopes.

53782 Magnetic moment of the 2_1^+ state in ^{98}Sr. Wolf, A. (Brookhaven National Laboratory, Upton, New York 11973 (US)); Sistemich, K.; Mach, H.; Gill, R.L.; Casten, R.F.; Winger, J.A. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 932-935 (Aug 1989). DOE Contract AC02-76CH00016.

The g factor of the 2_1^+ state in ^{98}Sr was measured by the perturbed angular correlation method at a fission product on-line separator. The result, g=0.38(7), is discussed in the framework of the proton-neutron interacting boson approximation and in relation to $g(2_1^+)$ values for two other N=60 isotones, ^{100}Zr and ^{102}Mo.

Results of the analysis of data from the HELIOS experiment at CERN are reported. Data of protons, ^{16}O and ^{32}S on various nuclear targets at 200 GeV/u, and 450 GeV/c proton data have been recorded. Individual charged particle and photon data were measured with a magnetic spectrometer in the rapidity region 0.9<eta<1.9. The systematics of the p_T-spectra is discussed. Photons near mid-rapidity recorded with a BGO-matrix exhibit an unexplained excess above the rates expected for hadronic decays and bremsstrahlung in the region p_T<30 MeV/c. (orig.).

53785 Neutron scattering in ^{189}Os for nucleosynthesis rates of the odd-A Os isotopes and nucleochronology. McEllistrem, M.T. (Department of Physics and Astronomy, University of Kentucky, Lexington, Kentucky 40506 (US)); Winters, R.R.; Hershberger, R.L.; Cao, Z.; Macklin, R.L.; Hill, N.W. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 591-600 (Aug 1989).

Neutron elastic and inelastic scattering cross sections have been determined for neutrons incident on ^{189}Os at three very low energies. Cross sections for scattering to the ground state and 36.2-keV excited level have been measured for incident energies of 63.5 and 73.3 keV, and also to the 69.6-keV excited level at 97.5-keV incident energy. These measurements are combined with neutron scattering cross sections for ^{187}Os, neutron capture cross sections, and other low-energy scattering observables to provide a basis for a single, consistent model of all data for both odd-A Os isotopes. The properly interpreted capture rates are important for the Re/Os nucleochronology and for s-process nucleosynthesis rates. The elastic and inelastic scattering cross sections provide a very-low-energy test of statistical model-flux distributions; model accuracy at very low energies is an important issue for reaction rates used in nucleosynthesis estimates.

53786 Neutron emission from products of strongly damped reactions ^{58}Ni+^{165}Ho at 930 MeV. Petitt, G.A. (Georgia State University, Atlanta, Georgia 30303 (US)); Butler, C.; Penumetcha, V.; Awes, T.C.; Beene, J.R.; Ferguson, R.L.; Obenshain, F.E.; Plasil, F.; Young, G.R.; Sorensen, S.P.; and others. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 692-705 (Aug 1989). DOE Contract AC05-84OR21400.

Neutron time-of-flight spectra have been measured for emission from products of reactions between ^{58}Ni and ^{165}Ho at a bombarding energy of 930 MeV. Neutrons were detected in coincidence with projectilelike fragments from strongly damped reactions using a heavy ion ΔE-E telescope which permitted the total kinetic energy loss to be extracted for each event. The neutron spectra were separated into 25-MeV-wide total kinetic energy loss bins over the total kinetic energy loss range from 0 to 450 MeV. Moving source fits were made to the neutron spectra to determine emission temperatures, multiplicities, velocities, and angles for the projectilelike fragment, targetlike fragment, and nonequilibrium emission sources as a function of the total kinetic energy loss. The extracted temperature of the projectlike fragment is found to be larger than that of the targetlike fragment source at all total kinetic energy losses, approaching that of the targetlike fragment only at the largest total kinetic energy losses. The results suggest an equal division of the available excitation energy at small total kinetic energy loss with a thermal energy division occurring only at the largest total kinetic energy losses. The velocity of the nonequilibrium source is found to remain constant at approximately one-half of the beam velocity independent of the final projectlike fragment velocity. This result supports models of nonequilibrium emission in which nucleon emission is isotropic in the nucleon-nucleon center-of-mass system as opposed to models in which the nonequilibrium emission occurs isotropically from the heavy fragments along their reaction trajectories.

53787 High-spin studies of ^{172,173}Os: Complex alignment mechanism. Wells, J.C. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 (US)); Johnson, N.R.; Baktash, C.; Lee, I.Y.; McGowan, F.K.; Riley, M.A.; Virtanen, A.; Dudek, J. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 725-741 (Aug 1989). DOE Contract AC05-84OR21400.

High-spin states of ^{172}Os have been investigated by γ-γ coincidence studies. These states were populated by the ^{144}Nd(^{32}S,4n) reaction using 162-MeV ^{32}S ions. Gamma-gamma coincidence measurements were made with a Compton-suppression spectrometer system. The yrast band was observed up through the 30$^+$ state, and four sidebands were deduced from γ-γ coincidence relationships. A band identified as belonging to ^{173}Os was also observed. Results were interpreted using average nuclear field calculations which incorporated the deformed Woods-Saxon potential with its "universal" parametrization, a cranking approximation, and the Hartree-Fock-Bogoliubov method. The calculations indicate the presence of strongly interacting quasiparticle band crossings for 0.2<$\hbar\omega$<0.3, in semiquantitative agreement with experiment. Both the quasiparticle band structures and decline of neutron pairing are discussed.

53788 Exotic N=82 nuclei ^{153}Lu and ^{154}Hf and filling of the $\pi h_{11/2}$ subshell. McNeill, J.H. (Department of Physics, Schuster Laboratory, University of Manchester, Manchester M139PL, United Kingdom (GB)); Blomqvist, J.; Chishti, A.A.; Daly, P.J.; Gelletly, W.; Hotchkis, M.A.C.; Piiparinen, M.; Varley, B.J.; Woods, P.J. *Physical Review Letters (USA),* 63(8): 860-863 (21 Aug 1989).

Microsecond isomers in the very proton-rich N=82 nuclei ^{153}Lu and ^{154}Hf have been identified by γ-ray spectroscopy following mass analysis of ^{102}Pd +245 MeV ^{54}Fe reaction products using the Daresbury Recoil Separator. The decays of the isomers, interpreted as $(\pi h_{11/2})^n$ states, are characterized. Examination of reduced $E2$ transition rates between $(\pi h_{11/2})^n$ states in the N=82 isotones indicates that the half-filling of the $\pi h_{11/2}$ subshell occurs just below Z=71.

53789 (CENBG–88-27) **Two-proton interferometry at backward angles in ^{16}O + ^{197}Au at E/A = 94 MeV.** Lautridou, P.; Quebert, J.; Lebrun, C.; Guilbault, F.; Goujdami, D.; Durand, D.; Ardouin, D.; Peghaire, A.; Saint-Laurent, F. Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires. 1988. 13p. Order Number DE90713778. Available from NTIS (US Sales Only), PC A03/MF A01.

Backward angle measurements of the p-p correlation function at small relative momenta exhibit a damping of final state interactions. This new shape is analysed in the framework of Fermi-Dirac statistical effects for which a characteristic lifetime of the order of 10^{-21}s is deduced.

53790 (DOE/ER/40330–34) **Nuclear structure from radioactive decay: Annual progress report.** Wood, J.L. Georgia Inst. of Tech., Atlanta, GA (USA). School of Physics. 30 Sep 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER40330. Order Number DE90001229. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A program has been initiated to systematically study the structure of the very neutron-deficient nuclei in and near the region of deformation with Z > 50, N < 82. This has necessitated ion-source development. Radioactive decay is the only way to observe low-spin states in this region. Only with such information will details of the nuclear shape and nuclear stability in this new region of deformation be understood. This report discusses work done in this Z region.

53791 (INIS-mf–12006, pp. 47-48) **Forward-backward asymmetry at direct break-up of ^{6}Li.** Hesselbarth, J.; Khan, S.; Kihm, T.; Knoepfle, K.T. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The (α+d) breakup of 60 MeV ^{6}Li scattered from ^{208}Pb has been measured inside the grazing angle for c.m. energies of the fragments between 100 keV and 1.5 MeV. The distinctly different anisotropies of the sequential and direct breakup components show that Coulomb dissociation cannot be related in a straightforward manner to the astrophysically relevant $^{4}He(d,\gamma)^{6}Li$ capture reaction. (orig.).

53792 **Observation of superdeformation in ^{191}Hg.** Moore, E.F. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); Janssens, R.V.F.; Chasman, R.R.; Ahmad, I.; Khoo, T.L.; Wolfs, F.L.H.; Ye, D.; Beard, K.B.; Garg, U.; Drigert, M.W.; and others. *Physical Review Letters (USA),* 63(4): 360-363 (24 Jul 1989). DOE Contract W-31-109-ENG-38;AC07-76ID01570;FG02-87ER40346.

The first observation of superdeformation in the mass region $A \cong 190$ is reported. A rotational band of twelve transitions with an average energy spacing of 37 keV, an average moment of inertia $\mathcal{J}^{(2)}$ of 110 $\hbar^2$ MeV^{-1}, and an average quadrupole moment of 18±3 e b has been observed in ^{191}Hg; this band persists at low rotational frequency. These results are in excellent agreement with a calculation that predicts an ellipsoidal axis ratio of 1.65:1 for the superdeformed shape in this nucleus.

Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The γ-decay of the ^{236}U shape isomer at E_{II}=(2.75+-0.01) MeV has been observed, as reported last year. The ratio of γ-decay to delayed fission - the competing process - has been determined to $\Gamma_{F\gamma}/\Gamma_{FI}$=8+-3. Four different cascades depopulating the shape isomer are found and investigated in detail. With regard to that, the excitation function and the γ-γ angular correlation are discussed. With the same method it is also possible to search for other shape isomers, e.g. in the thorium isotopes. First results in a $^{232}Th(d,p)^{233}Th$ experiment show an isomeric state with an excitation energy of E_{II}=2.8 MeV and a halflive of $t_{1/2}$=17 ns, which might be a good candidate for a shape isomer in ^{233}Th. (orig.).

53794 (INIS-mf–12006, pp. 72) **Spectroscopic investigation of the neutron-deficient ^{220}Th.** Heller, F. (Heidelberg Univ. (Germany, F.R.). Available from NTIS (US Sales Only), PC A09/MF A01.

The investigation of side bands in ^{232}Th, performed by a Coulomb excitation experiment with 396 MeV ^{90}Zr-projectiles was completed. Thereby a new band with a band-head at 1414 keV was discovered. We propose this band to be the two phonon $\gamma\gamma$-band. To prove the spin assignment of the 1414 keV state unambiguously, a new particle-γ correlation measurement has been performed. (orig.).

53796 (INIS-mf–12006, pp. 80-82) **Investigation of inelastic scattering and transfer reactions at the system ^{18}O -> ^{232}Th by the crystal ball.** Klein, H. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Habs, D.; Heyng, H.W.; Gerl, J.; Ender, C.; Korten, W.; Schwalm, D. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Transfer reactions and inelastic scattering around the Coulomb barrier has been studied in the system ^{18}O->^{232}Th. Impact parameter dependent form factors have been determined for several neutron transfer channels. The pick-up channels show the expected increase of the form factor slope with increasing number of transfered neutrons, whereas the slope of the 2n pick-up channel appears to be to flat. The inelastic channel reveals a strong enhancement of collective vibrational states in ^{232}Th. Especially the two phonon $\gamma\gamma$ bandhead has five times the intensity of what is expected from pure Coulomb excitation. (orig.).

T-12589.

Absolute measurement of the ^{239}Pu fast fission cross-section have been carried out at a neutron generator of the TU Dresden and at the tandem van-de-Graaf accelerator of the CINR Rossendorf (GDR) in 1977-1985, using the Time-Correlated Asasociated Particles Method (TCAPM) at selected neutron energy spot points. Experimental investigations at the OuF_4 fission foils led to absorpotion correctrions of the several samples, which are 2.7-4.7% higher than assumed earlier. Consequently, the correction of the preliminary data results in higher $^{239}Pu(n,f)$-values. Following the presented measurements, a revision of the current files is indicated within the covered neutron energy range. 40 refs.; 10 figs.; 2 tabs.

T-12589.

Experimental details and preliminary results of absolute measurements, carried out at the CINR Rossendorf by the TU Dresden/RI Leningrad cooperation are reviewed. Using the Time-Correlated Associated Particle Method (TCAPM), uncertainties of 1.8% and 2.9% were obtained at 8.4 MeV and 18.8 MeV neutron energies, respectively. Because of progresses in the experimental technique, the properties of the fission deposits became the restrictive factor of the experimental accuracy in these measurements. A first short run with poor statistics at 4.8 MeV resulted in a standard deviation of 2.8% for the U-238 (n,f) cross section. 22 refs.; 6 figs.; 2 tabs.

53819 (UCRL–101613) **Some neutron and photon reactions on the ground and isomeric states of ^{236,237}Np.** Gardner, D.G.; Gardner, M.A. Lawrence Livermore National Lab., CA (USA). 11 Sep 1989. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890982–3: International meeting on neutron activation cross section for fission and fusion energy applications, Argonne, IL (USA), 11-15 Sep 1989). Order Number DE90001508. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We present results of calculated neutron- and photon-induced reactions on the 1.1 × 10^5–y ground state and 22.5-h isomer of ^{236}Np and on the 2.1 × 10^6–y ground state and 68-ns isomer of ^{237}Np. Of primary concern are the isomeric ratios produced although some photon absorption and photoneutron results are given. We discuss the production of the short-lived isomer of ^{236}Np, via the (n,2n) and (γ,n) reactions on ^{237}Np, leading eventually to the high-energy γ-ray emitter, ^{208}Pb; the photoproduction and destruction of the 60-keV, 68-ns isomer of ^{237}Np, a possible gamma-ray laser candidate; and the use of photoexcitation and destruction of nuclear isomers in the field of nuclear waste disposal. The effect of the choice of the physics parameters on the calculated results is also illustrated. 14 figs., 2 tabs.

53820 Spontaneous fission properties of ^{258}Fm, ^{259}Md, ^{260}Md, ^{258}No, and ^{260}[104]: Bimodal fission. Hulet, E.K. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94551 (US)); Wild, J.F.; Dougan, R.J.; Lougheed, R.W.; Landrum, J.H.; Dougan, A.D.; Baisden, P.A.; Henderson, C.M.; Dupzyk, R.J.; Hahn, R.L.; and others. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 770-784 (Aug 1989). DOE Contract W-7405-ENG-48.

We have measured the mass and kinetic-energy distributions from the spontaneous fission of ^{258}Fm, ^{258}No, ^{259}Md, ^{260}Md, and ^{260}[104]. All are observed to fission with a symmetrical division of mass. The total-kinetic-energy distributions strongly deviated from the Gaussian shape characteristically found in the fission of all other actinides. When the total-kinetic-energy distributions are resolved into two Gaussians, the constituent peaks lie near 200 and 233 MeV. We conclude that both low- and high-energy fission modes occur in four of the five nuclides studied. We call this property "bimodal fission." Even though both modes are possible in the same nuclide, one generally predominates. We offer an explanation for each mode based on shell structures of the fissioning nucleus and of its fragments. The appearance of both modes of fission in this region of the nuclide chart seems to be a coincidence in that the opportunity to divide into near doubly magic Sn fragments occurs in the same region where the second fission barrier is expected to drop in energy below the ground state of the fissioning nucleus. Appropriate paths on the potential-energy surface of deformation have been found by theorists, but no physical grounds have been advanced that would allow the near equal populations we observe traveling each path. We suggest that this failure to find a reason for somewhat equal branching may be a fundamental flaw of current fission models. Assuming the proposed origins of these modes are correct, we conclude the low-energy, but also mass-symmetrical mode is likely to extend to far heavier nuclei. The high-energy mode will be restricted to a smaller region, a realm of nuclei defined by the proximity of the fragments to the strong neutron and proton shells in ^{132}Sn.

The Yukawa-plus-exponential finite-range model and the standard liquid-drop model are shortly reviewed and compared. The dependence of the barrier heights and of the saddle-point shapes on mass-asymmetry and on angular momentum is studied for the compound nuclei ^{110}Sn, ^{149}Tb and ^{194}Hg. The predicted asymmetric-fission barriers, charge yields and total kinetic energies are compared with experimental data obtained from the deexcitation of compound nuclei by complex-fragment emission.

This report summarizes progress during the past year in the following areas of research: Pion charge exchange reactions, including a theory of the contribution of pion absorption and correlated double scattering to double charge exchange, new coupled channel calculations for single and double charge exchange from ^{14}C. Nuclear inelastic scattering, using quark models to calculate nuclear structure functions, and test for sensitivity to the substructure of nucleons in nuclei. Fluctuation-free statistical spectroscopy including the theory and computer programs for interacting-particle densities, spin cutoff factors, occupancies, strength sums, and other expectation values. Proposed research for the coming year in each area is presented.

53823 (INIS-mf–12006, pp. 57-58) **β-decay half-lives.** Staudt, A. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Bender, E.; Klapdor, H.V.; Muto, K. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The β decay half-lives of neutron-rich isotopes with Z=6-108 between the line of beta stability and the neutron drip line are calculated in second generation microscopic calculations using the QRPA with a Gamow-Teller residual interaction. As an astrophysical application of the calculated strength functions the neutrino capture cross sections of ^{69,71}Ga are discussed. (orig.).

53824 (INIS-mf–12006, pp. 58) **Calculation of β-delayed processes.** Staudt, A. (Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)); Bender, E.; Klapdor, H.V.; Muto, K. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The results of the calculations of the β-strength functions are used to predict β-delayed neutron emission and β-delayed fission probabilities (P_n and $P_{\beta df}$). The results are of importance for the smoothing of the odd-even staggering in the final element abundances in the astrophysical r-process. The fission rates may have considerable influence on the production of heavy elements in nature as well as in thermonuclear explosions. (orig.).

53825 (INIS-mf–12006, pp. 58-60) **Calculation of 2ν double beta decay for ^{100}Mo, ^{136}Xe and ^{150}Nd in the QRPA.** Muto, K.; Bender, E.; Klapdor, H.V. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Half-lives of 2ν $\beta\beta$ decay are calculated in the quasiparticle random phase approximation (QRPA) with a realistic nucleon-nucleon interaction. Limitations of the QRFA approach are investigated. (orig.).

53826 (INIS-mf–12006, pp. 63-64) **Total Gamow-Teller strengths from measured g.s. correlations.** Knoepfle, K.T.; Mairle, G.; Seeger, M. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Recently developed model-independent sum rules for Gamow-Teller transitions as observed in (p,n) and (n,p) reactions are applied to all stable even-even target nuclei between ^{16}O and ^{58}Ni and to ^{90}Zr. The total Gamow-Teller strengths S(p,n) and S(n,p),

which depend sensitively on ground state correlations, are calculated by the use of measured occupation numbers deduced from proton- and neutron-pickup and stripping experiments. The results are at variance with experimental observations, thus leaving the problem of the missing Gamow-Teller strengths in (p,n) and (n,p) reactions unresolved. (orig.).

53827 (INIS-mf–12006, pp. 76-78) **Coulomb scattering of aligned heavy ions.** Grawert, G.; Voelk, H.G.; Becker, K.; Derner, J.C.; Fick, D.; Korsch, W.; Leucker, H.; Luck, W.; Pohlenz, D.; Reich, H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

A new formalism to describe the Coulomb scattering of polarized heavy ions has been developed. ^{7}Li scattering data have been reanalyzed with this theory. Measurements for the scattering of polarized ^{23}Na are in progress. (orig.).

53838 (ISN–88-72) **Giant dipole modes in heavy-ion reactions.** Suraud, E.; Schuck, P.; Pi, M. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Jul 1988. 46p. Order Number DE90713762. Available from NTIS (US Sales Only), PC A03/MF A01.

A detailed study of the excitation of giant dipole modes (GDR) in intermediate energy heavy-ion collisions is presented in the framework of a full (non linearized) Landau-Vlasov equation. After having recalled the basic inputs of this dynamical formalism, within insisting upon the limitations of the Uehling-Uhlenbeck collision integral and upon the introduction of a realistic (isospin dependant) effective interaction, we present our tools for analysing the GDR in the simple case of isolated nuclei. We then pass on to simulations of collisions and discuss in some detail isospin modes in the model $^{12}Be + ^{12}C$ reaction. Results obtained for the energy of the excited dipole mode are in agreement with what is expected for excited, rotating, giant dipole oscillations in deformed nuclei.

53839 (LAPP-TH–238-89) **Higgs boson production at CLIC in Susy models with hierarchy of the vacuum expectation values.** Chiappetta, P.; Kalinowski, J. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. Jan 1989. 15p. Order Number DE90713767. Available from NTIS (US Sales Only), PC A03/MF A01.

We discuss mechanisms for production at CLIC energy of neutral Higgs bosons of the minimal supersymmetric model. In particular we concentrate on scenarios with a large ratio of the vacuum expectation values $v_2/v_1 \simeq m_t/m_b$.

53840 (LA-UR–89-3198) **Algebraic description of intrinsic modes in nuclei.** Leviatan, A. Los Alamos National Lab., NM (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8907150–1: 12. course of the International School of Nuclear Physics: the nature of hadrons and nuclei studied by electron scattering, Erice (Italy), 16-25 Jul 1989). Order Number DE90000691. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We present a procedure for extracting normal modes in algebraic number-conserving systems of interacting bosons relevant for collective states in even-even nuclei. The Hamiltonian is resolved into intrinsic (bandhead related) and collective (in-band related) parts. Shape parameters are introduced through non-spherical boson bases. Intrinsic modes decoupled from the spurious modes are obtained from the intinsic part of the Hamiltonian in the limit of large number of bosons. Intrinsic states are constructed and serve to evaluate electromagnetic transition rates. The method is illustrated for systems with one type of boson as well as with proton-neutron bosons. 28 refs., 1 fig.

53841 (LBL–27502) **Thermal and statistical properties of nuclei and nuclear systems.** Moretto, L.G.; Wozniak, G.J. Lawrence Berkeley Lab., CA (USA). Jul 1989. 102p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8907154–1: Enrico Fermi summer course CX11: nuclear collisions from the mean field into the fragmentation regime, Varenna (Italy), 11-21 Jul 1989). Order Number DE90000183. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

The term statistical decay, statistical or thermodynamic equilibrium, thermalization, temperature, etc., have been used in nuclear physics since the introduction of the compound nucleus (CN) concept, and they are still used, perhaps even more frequently, in the context of intermediate- and high-energy heavy-ion reactions. Unfortunately, the increased popularity of these terms has not made them any clearer, and more often than not one encounters sweeping statements about the alleged statisticity of a nuclear process where the "statistical" connotation is a more apt description of the state of the speaker's mind than of the nuclear reaction. It is our goal, in this short set of lectures, to set at least some ideas straight on this broad and beautiful subject, on the one hand by clarifying some fundamental concepts, on the other by presenting some interesting applications to actual physical cases. 74 refs., 38 figs.

53842 (N–89-25103) **Kaon-nucleus scattering.** Hong, Byungsik; Maung, K.M.; Wilson, J.W.; Buck, W.W. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. 1989. 30p. (NASA-TP–2920;L–16583;NAS–1.60:2920). Available from NTIS, PC A03/MF A01.

The derivations of the Lippmann-Schwinger equation and Watson multiple scattering are given. A simple optical potential is found to be the first term of that series. The number density distribution models of the nucleus, harmonic well, and Woods-Saxon are used without t-matrix taken from the scattering experiments. The parameterized two-body inputs, which are kaon-nucleon total cross sections, elastic slope parameters, and the ratio of the real to the imaginary part of the forward elastic scattering amplitude, are presented. The eikonal approximation was chosen as our solution method to estimate the total and absorptive cross sections for the kaon-nucleus scattering.

53843 (TRI-PP–89-53) **Quenching of the Gamow-Teller matrix element in closed-LS-shell-plus-one nuclei.** Towner, I.S. British Columbia Univ., Vancouver, BC (Canada). TRIUMF Facility. Jun 1989. 3p. (CONF-8906160–3: Yamada conference on nuclear weak process and nuclear structure, Osaka (Japan), 12-15 Jun 1989). Order Number DE90001192. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

It is evident that nuclear Gamow-Teller matrix elements determined from β-decay and charge-exchange reactions are significantly quenched compared to simple shell-model estimates based on one-body operators and free-nucleon coupling constants. Here we discuss the theoretical origins of this quenching giving examples from light nuclei near LS-closed shells, such as ^{16}O and ^{40}Ca. 12 refs., 2 tabs.

53844 (UCRL–101906) **Consequences of dynamic and phase space constraints in medium energy heavy ion collisions.** Blann, M. Lawrence Livermore National Lab., CA (USA). Oct 1989. 14p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8910237–1: International school seminar on heavy ion physics, Dubna (USSR), 3-12 Oct 1989). Order Number DE90000838. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The goals of this presentation are twofold; to summarize the current status of the interpretation of energetic γ-rays in heavy ion collisions via the n-p-bremsstrahlung mechanism, and to look briefly at the topic of multi-fragmentation. One tool will be used as the basis of the first topic, and as an essential element of the second, i.e. a transport equation to approximate the fast non-equilibrium nucleon-nucleon cascade/emission stage of the reaction. It is during this stage that we expect the n-p-bremsstrahlung processes to produce energetic photons. We will also use the transport model to estimate the average equilibrated nucleus produced in a heavy ion reaction, and then investigate the multi-fragmentation expectation of such an equilibrated nucleus using a straightforward evaporation model. With these two goals in mind I shall begin with a very brief description of the Boltzmann master equation (BME) model which will be used as the transport code, deferring to earlier works for a more complete description, and present but a single representative comparison with an experimental neutron emission spectrum. I shall then summarize the status of the elementary n-p-γ cross section needed to extend the transport code to photon emission in heavy ion reactions, and summarize the status of these comparisons with data. Next the BME will be used to estimate the mass, charge and excitation of the average equilibrated nucleus formed in the interaction of 35 MeV/nucleon ^{36}Ar with ^{238}U; a case which has been investigated recently. I shall describe the manner used to treat the de-excitation of this system via Weisskopf evaporation theory, and compare calculated and measured multi-fragmentation multiplicity yields. 33 refs., 10 figs.

53845 An octupole two-phonon multiplet in ^{96}Zr and its description within the spdf interacting boson model. Kusnezov, D.F. (Michigan State Univ., East Lansing (USA). Dept. of Physics and Astronomy); Henry, E.A.; Meyer, R.A. *Physics Letters [Section] B (Netherlands)*, 228(1): 11-15 (7 Sep 1989).

Members of a two-phonon octupole vibrational multiplet in ^{96}Zr and their mixing with other positive parity levels are discussed. Calculations within the spdf boson version of the interacting boson model which includes intruder configuration mixing are compared with the experimentally observed properties. (orig.).

53846 Fusion rates of squeezed and screened hydrogenic nuclei. Benesh, C.J. (Physics Department, Iowa State University, Ames, Iowa 50011 (US)); Vary, J.P. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 495-496 (Aug 1989).

We calculate the barrier penetration factor for hydrogen-like ions confined in a potential well as a function of the equilibrium separation and screening length of the medium. We show the penetration factor is extremely sensitive to these parameters, independently and in combination. The parameter values required to produce the high fusion rates reported for palladium hydride systems, however, are far from typical for these systems.

53847 Branching ratios for ^{3}He$(\alpha,\gamma)^7$Be and ^{3}H$(\alpha,\gamma)^7$Li. Kajino, T. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550 (US)); Mathews, G.J.; Ikeda, K. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 525-530 (Aug 1989). DOE Contract W-7405-ENG-48.

Branching ratios for radiative alpha capture by tritium and ^{3}He have been studied in a kinematical direct capture model for the purpose of obtaining an independent derivation of the ^{3}H$(\alpha,\gamma)^7$Li branching ratio and possibly resolving an apparent discrepancy in the experimentally measured value. From the mirror symmetry between ^{7}Li and ^{7}Be, and the observed branching ratio $R(0)=0.38\pm0.04(1\sigma)$ for the ^{3}He$(\alpha,\gamma)^7$Be reaction, the branching ratio for the ^{3}H$(\alpha,\gamma)^7$Li reaction is constrained to be $R(0)=0.47\pm0.07$, which agrees best with the higher measured value. The implication of these results for big-bang nucleosynthesis in standard and nonstandard models is discussed.

53848 Possible dynamic effects in the particle decay of ^{59}Cu compound nuclei. Fornal, B. (Institute of Nuclear Physics, Cracow, Poland (PL)); Viesti, G.; Nebbia, G.; Prete, G. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 664-667 (Aug 1989).

The slopes of the energy spectra of p, d, t, and α particles emitted from ^{59}Cu nuclei formed in the reaction of ^{32}S+^{27}Al at a bombarding energy of 150 MeV are described by statistical-model calculations in which the deformation is frozen during the first two steps of the deexcitation chain. The resultant fits to the high-energy portions of the spectra are comparable to those previously obtained by modifying the spin dependence of the level density, suggesting that dynamic effects may be important in evaporation from light nuclei.

53849 Influence of rotation-induced nuclear deformation on α-particle evaporation spectra. Huizenga, J.R. (Department of Chemistry and Nuclear Structure Research Laboratory, University of Rochester, Rochester, New York 14627 (US)); Behkami, A.N.; Govil, I.M.; Schroder, W.U.; Toke, J. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 668-680 (Aug 1989).

The shapes of α-particle spectra from hot, high-spin compound nuclei produced in energetic heavy-ion fusion reactions are analyzed within the framework of a statistical model. Contrary to claims made in the literature, good agreement is obtained between calculated and experimental spectra when the evaporation barrier of each nuclide in the complex cascade is assumed equal to its respective absorption channel barrier. The dependence of the shape of α-particle spectra on nuclear deformation is discussed both in terms of the transmission coefficients and the spin-dependent level density of deformed nuclei. For deformations of the magnitude given by the rotating liquid drop model, α-particle spectra and effective barriers are insensitive to whether deformed or spherical nucleus transmission coefficients are used. It is important, however, to include the deformation dependence in the nuclear level density. Model calculations indicate that the shape of α-particle spectra may be quite insensitive to large deformations.

53850 Spin-orbit force in time-dependent Hartree-Fock calculations of heavy-ion collisions. Umar, A.S. (Department of Physics and Astronomy, Vanderbilt University, Nashville, Tennessee 37235 (US)); Strayer, M.R.; Reinhard, P.; Davies, K.T.R.; Lee, S. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 706-714 (Aug 1989). DOE Contract AC05-84OR21400.

We discuss the time-dependent Hartree-Fock equations which maintain independent nucleon spin degrees of freedom, and which include spin-orbit interactions. The complex numerical task of including the spin-orbit force in reaction studies is described in detail.

53851 Final-state interactions and relativistic effects in the quasielastic (e,e') reaction. Chinn, C.R. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742 (US)); Picklesimer, A.; Van Orden, J.W. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 790-812 (Aug 1989).

The longitudinal and transverse response functions for the inclusive quasielastic (e,e') reaction are analyzed in detail. A microscopic theoretical framework for the many-body reaction provides a clear conceptual (nonrelativistic) basis for treating final-state interactions and goes far beyond simple plane-wave or Hermitean potential models. The many-body physics of inelastic final-state channels as described by optical and multiple scattering theories is properly included by incorporating a full complex optical potential. Explicit nonrelativistic and relativistic momentum-space calculations quantitatively demonstrate the importance of such a treatment of final-state interactions for both the transverse and longitudinal response. Nonrelativistic calculations are performed using final-state interactions based on phenomenology, local density models, and microscopic multiple scattering theory. Relativistic calculations span a similar range of models and employ Dirac bound-state wave functions. The theoretical extension to relativistic dynamics is of course not clear, but is done in obvious parallel to elastic proton scattering. Extensive calculations are performed for ^{40}Ca at momentum transfers of 410, 550, and 700 MeV/c. A number of interesting physical effects are observed, including significant relativistic suppressions (especially for R_L), large off-shell and virtual pair effects, enhancement of the tails of the response by the final-state interactions, and large qualitative and even shape distinctions between the predictions of the various models of the final-state interactions. None of the models is found to be able to simultaneously predict the data for both response functions. This strongly suggests that additional physical mechanisms are of qualitative importance in inclusive quasielastic electron scattering.

53852 Proton-induced production of η on nuclei. Liu, L. (Isotope and Nuclear Chemistry Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87544 (US)); Londergan, J.T.; Walker, G.E. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 832-842 (Aug 1989).

The features of the $(p,p'\eta)$ reaction are examined for incident proton energies between 0.8 and 1.6 GeV. Reactions are calculated for exclusive transitions in which the continuum proton and η are observed in coincidence. This process should be dominated by transitions $N+N\rightarrow N+N+\eta$ involving intermediate excitation of one of the nucleons to an $N(1535)$ isobar. We take phenomenological amplitudes for the process $\pi+N\rightarrow\eta+N$ in the nuclear medium. A theoretical formalism for the reaction amplitudes is derived and examined in detail. Nuclear distortions of the hadrons are estimated in the eikonal approximation. The theoretical cross sections are shown to be dominated by a single production amplitude. This results in the prediction that η production should occur entirely through $\Delta T=1$ non-normal parity nuclear transitions; i.e., that the nuclear states excited should show the spin-isospin characteristics of the exchanged meson. Peak reaction cross sections are predicted to have a strong dependence on the incident proton energy. Expected peak cross sections, for a target like ^{16}O, are on the order of 1 μb/sr^2 MeV.

53853 Off-shell effects from meson exchange in the nuclear optical potential. Elster, C. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742 (US)); Tandy, P.C. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 881-886 (Aug 1989).

First-order Kerman-McManus-Thaler nuclear optical potentials for intermediate energy protons are constructed from realistic meson-exchange models of the nucleon-nucleon interaction including off-shell effects. At 200 MeV the full model developed by the Bonn group is employed, while at 500 MeV a simplified version with delta resonance inelasticity is used. The resulting off-shell effects on the nuclear scattering spin observables are found to be substantial.

53854 Observable effects of poles and shadow poles in coupled-channel systems. Pearce, B.C. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Gibson, B.F. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(2): 902-911 (Aug 1989).

Using separable potentials in a coupled-channel Lippmann-Schwinger equation, we investigate the motion of poles on the different Riemann sheets and their observable effects as the coupling strength is varied. Only in the weak-coupling limit can one determine in which uncoupled channel the pole originated by the sheet on which it lies. Cusp structure versus resonance peak as one crosses a threshold is found to depend on the distance of the pole from the physical sheet. Resonance poles in each uncoupled channel can produce double-loop Argand plots similar to those seen in πN P_{11} amplitude analysis.

53855 **Generalization of the sum rule for double Gamow-Teller operators.** Zheng, D.C. (Department of Physics and Astronomy, Rutgers University, Piscataway, New Jersey 08855 (US)); Zamick, L.; Auerbach, N. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 936-939 (Aug 1989).

We show that for Pauli-blocked nuclei, in the closure approximation, the summed strength for the double Gamow-Teller $0^+ \rightarrow 0^+$ transitions is *less* than the value $6(N-Z)(N-Z+1)$ and that the difference can be related to sum rules for magnetic dipole transitions, which in turn can be related to the double Gamow-Teller matrix element for the transition from the 0^+ initial state to its double isobaric analog state. A "wrong isospin phase sum rule" is found that is valid in limited cases.

53856 **Adiabatic time-dependent Hartree-Fock theory in the generalized valley approximation.** Bulgac, A. (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104 (US)); Klein, A.; Walet, N.R.; Do Dang, G. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 945-959 (Aug 1989).

A classical theory of large amplitude, adiabatic collective motion, developed and applied previously to test examples, is transcribed into the language of time-dependent Hartree-Fock theory in order to initiate the application of the new method to problems in nuclear physics. The formulation which emerges can be characterized as a generalized cranking theory, in the sense that the cranking operator cannot be chosen arbitrarily, as in the conventional formulation of this method, but is instead fully constrained by the formalism. A procedure for obtaining approximate solutions to the new equations is described and illustrated with several simplified many-body models. It is inferred that traditional cranking calculations can serve as starting points for more realistic models. This paper also includes additional discussion concerning the calculation of collective masses and the problem of local stability of collective motion, not covered in our previous work.

53857 **Parton bremsstrahlung as a mechanism of energy deposition in high-energy hadron-nucleus and nucleus-nucleus collisions.** Mrowczynski, S. (Department of Physics, University of Arizona, Tucson, Arizona 85721 (US)); Rafelski, J. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 1077-1080 (Aug 1989).

On the basis of perturbative quantum chromodynamics, we consider the bremsstrahlung energy losses of partons traversing *parton matter* using the well-known quantum electrodynamical formulas. We find the transport equation describing the energy distribution of partons as a function of thickness of a target. The equation is solved numerically and we briefly discuss the relevance of our results for hadron-nucleus and nucleus-nucleus collisions at high energies.

53858 **Comparison of two methods for calculating finite-temperature ring diagrams.** Yang, S.D. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794 (US)); Jiang, M.F.; Kuo, T.T.S.; Ellis, P.J. *Physical Review [Section] C: Nuclear Physics (USA),* 40(2): 1085-1088 (Aug 1989).

Certain types of ring diagrams of the thermodynamic potential Ω can be summed up to all orders using two apparently very different methods—the eigenvalue method and the transition-amplitude method. A relatively simple derivation of these methods is given, and we show that these two methods are exactly equivalent to each other. To study their numerical applications we have calculated the particle-particle, hole-hole ring diagrams of Ω for nuclear matter with both methods, using a modified Gogny interaction. Our results suggest that the strength-parameter integration involved in the transition-amplitude method can be accurately performed using a small number of mesh points and both methods seem to be suitable for numerical calculations.

53859 (CONF-8909210–1) **Direction-dependent stopping power and beam deflection in anisotropic solids.** Crawford, O.H. Oak Ridge National Lab., TN (USA). 1989. 15p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San Sebastian (Spain); 4-7 Sep 1989. Order Number DE90001076. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Directional effects on the motion of swift ions in anisotropic media are studied. The stopping power is a function of the direction of the velocity relative to the principle axes of the medium, and there is a nonzero lateral force on the ion tending to bend its trajectory. These effects arise from the anisotropy of the dielectric response, and are distinct from channeling. Simple expressions are derived for the stopping power and lateral force in the nonrelativistic high-velocity limit, and calculations are performed for crystalline graphite. 6 refs., 7 figs.

53860 (CONF-8909210–2) **Interaction of low-energy electrons and positrons with condensed matter: Stopping powers and inelastic mean free paths from optical data.** Ashley, J.C. Oak Ridge National Lab., TN (USA). [1989]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San Sebastian (Spain); 4-7 Sep 1989. Order Number DE90001001. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An "optical-data model" is described for evaluating energy loss per unit pathlength and inelastic mean free path for low-energy electrons and positrons ($\lesssim$ 10 keV) from optical data on the medium of interest. Exchange between the incident electron and electrons in the medium is included. Results from the optical-data model are compared with previous theoretical calculations. 15 refs., 6 figs., 2 tabs.

53861 (INIS-SU–119/A) **Neutron physics. V. 3.** Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); AN SSSR, Moscow (USSR); AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. 53862 (KURRI-TR–317) **Calorimetric measurement of the heat deposition in an aluminum alloy in the KUR graphite-thermal-column.** Kawai, Takeshi; Utsuro, Masahiko; Okamoto, Sunao. Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1989. 18p. (In Japanese). Order Number DE90709975. Available from NTIS (US Sales Only), PC A03/MF A01.

We describe a calorimetric experiment to measure the heat deposition in an aluminum alloy in the KUR graphite-thermal column where the cold-moderator cell of the KUR cold neutron source would be set up. A cartridge-electric-heater imbedded in a spherical sample was used to estimate accurately the heat deposition by comparing the rate of temperature rise in case of heater power with that of reactor power. The heat deposition of 0.1 W/cm^3 was obtained at 5MW reactor power. (author).

53863 (N–89-24255) **A hierarchy of transport approximations for high energy heavy (HZE) ions.** Wilson, J.W.; Lamkin, S.L.; Hamidullah, F.; Ganapol, B.D.; Townsend, L.W. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. Jul 1989. 39p. (NASA-TM–4118;L–16572;NAS–1.15:4118). Available from NTIS, PC A03/MF A01.

The transport of high energy heavy (HZE) ions through bulk materials is studied neglecting energy dependence of the nuclear cross

sections. A three term perturbation expansion appears to be adequate for most practical applications for which penetration depths are less than 30 g per sq cm of material. The differential energy flux is found for monoenergetic beams and for realistic ion beam spectral distributions. An approximate formalism is given to estimate higher-order terms.

53864 (SAAS–377) **Attenuation coefficients of soils.** Martini, E.; Naziry, M.J. Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic). 1989. 20p. (In German). Order Number DE90606105. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

As a prerequisite to the interpretation of gamma-spectrometric in situ measurements of activity concentrations of soil radionuclides the attenuation of 60 to 1332 keV gamma radiation by soil samples varying in water content and density has been investigated. A useful empirical equation could be set up to describe the dependence of the mass attenuation coefficient upon photon energy for soil with a mean water content of 10%, with the results comparing well with data in the literature. The mean density of soil in the GDR was estimated at 1.6 g/cm^3. This value was used to derive the linear attenuation coefficients, their range of variation being 10%. 7 figs., 5 tabs. (author).

53865 Asymptotic solutions of numerical transport problems in optically thick, diffusive regimes II. Larsen, E.W. (Department of Nuclear Engineering, The University of Michigan, Ann Arbor, Michigan 48109 (US)); Morel, J.E. *Journal of Computational Physics (USA),* 83(1): 212-236 (Jul 1989).

In a recent article (Larsen, Morel, and Miller, *J. Comput. Phys.* **69**, 283 (1987)), a theoretical method is described for assessing the accuracy of transport differencing schemes in highly scattering media with optically thick spatial meshes. In the present article, this method is extended to enable one to determine the accuracy of such schemes in the presence of numerically unresolved boundary layers. Numerical results are presented that demonstrate the validity and accuracy of our analysis. © 1989 Academic Press, Inc.

53866 Algorithms for solving inverse problems of transport theory. McCormick, N.J. *Transactions of the American Nuclear Society (USA),* 56: 254-255 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Inverse problems based on the neutral particle time-(in)dependent integrodifferential transport equation require measurement of the angular distribution of the particles for at least one spatial location (and sometimes more) in order to infer some property of the medium. While algorithms for solving inverse transport problems can appear to be straightforward to evaluate, they often are poorly conditioned (or ill posed) in the sense that small errors in measurements or an insufficient number of measurement directions can lead to unacceptably large errors in the desired result. This paper summarizes the status of the mathematical development and the numerical and (where applicable) experimental performance of time-(in)dependent inverse problem algorithms.

53867 Use of adjoint transport solutions for inverse problems. Renken, J.H. *Transactions of the American Nuclear Society (USA),* 56: 256-257 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Inverse problems represent a third major class of transport problems (after criticality-type problems and shielding-type problems). For the purpose of discussion here, an inverse problem is defined to be one in which a medium of interest emits some particular type of radiation, either spontaneously or when exposed to some other type of radiation. From a knowledge of the emitted radiation characteristics, one wishes to infer something about the medium that emits the detected radiation. An important example of a practical inverse problem is the geophysical logging of geological formations to determine the presence of minerals or hydrocarbons in the vicinity of a borehole. Proposals have also been made to detect hidden explosives by these methods. For a complete understanding of the apparatus used to solve inverse problems, it is important to know the characteristic interrogation distance of the method. Phrased more precisely, What is the relative contribution to the detector signal due to radiation particles emitted by different elements of volume in the medium being interrogated? As shown in the paper, it is possible to address this question with a computational procedure that utilizes adjoint transport solutions.

53868 The use of the inverse Monte Carlo method in nuclear engineering. Dunn, W.L. *Transactions of the American Nuclear Society (USA),* 56: 257-258 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The inverse Monte Carlo (IMC) method was introduced in 1981 in an attempt to apply Monte Carlo to the solution of inverse problems. It was argued that if direct Monte Carlo could be used to estimate expected values, which in the continuous case assume the form of definite integrals, then perhaps a variant could be used to solve inverse problems of the type that are posed as integral equations. The IMC method actually converts the inverse problem, through a noniterative simulation technique, into a system of algebraic equations that can be solved by standard analytical or numerical techniques. The principal merits of IMC are that, like direct Monte Carlo, the method can be applied to complex and multivariable problems, and variance reduction procedures can be applied.

53869 Explicit solution of three-dimensional inverse transport problems. Larsen, E.W. *Transactions of the American Nuclear Society (USA),* 56: 259-260 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

In recent year, substantial work has been performed on the problem of determining the cross sections of a system by introducing known steady-state neutron or photon flux distributions through the outer boundary of the system, measuring the exiting flux distributions, and then suitably processing this boundary flux information. In all of this work, the angular fluxes must be known at every point and every angle on the other boundary, and the resulting equations that relate the material cross sections to the incident and exiting boundary fluxes are ill conditioned. Here is proposed an entirely different solution having the following features: 1. The known incident fluxes must by pencil beams, i.e., delta functions in space, angle, and energy. 2. The detectors must be capable of measuring weak delta functions of angle, consisting of the uncollided flux generated by a line source. 3. Our solution is conceptually applicable in any convex geometry. 4. If the physical system is homogeneous, then our solution is explicit, requires only a few measurements, and is well conditioned.

53870 Multidimensional nodal transport methods for multiple-instruction multiple-data, distributed memory machines. Azmy, Y.Y. (Oak Ridge National Lab., TN (USA)). *Transactions of the American Nuclear Society (USA),* 56: 292-293 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

As computer hardware technology approaches the physical limits (on size and speed) of the electronic components of computer systems, it has become evident in recent years that any significant improvements in the performance of future systems must be rooted in advanced architectures. Efforts in this direction have resulted in numerous ideas and designs for vector and parallel processors. Among the many problems that have been implemented on the new systems is the neutron and photon transport equation. Monte Carlo-type methods have been implemented on shared-memory (SM) and distributed-memory (DM) multiple-instruction multiple-data (MIMD) machines. On the other hand, implementation of discrete ordinates-type methods on SM MIMD systems has been considered for general codes as well as special one-dimensional, multigroup codes. More recently, implementation of the latter code on the hypercube and the comparison between two chaotic and one ordered iterative schemes have been reported. In this paper the authors present the implementation of the zeroth and first-order two-dimensional nodal transport methods on the hypercube. The objective is to study the effect of the various parameters in a simple test problem on speedup and efficiency in order to determine the cases most suitable for solving on a DM machine, such as the hypercube.

53871 A nodal method for time-dependent transport equations. Badruzzaman, A. *Transactions of the American Nuclear*

Society (USA), 56: 303-305 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

Numerical time-dependent transport methods implicit in the time variable yield unconditionally stable solutions with mesh ratio, $r = v\Delta t/\Delta x$, greater than unity, thereby allowing large time steps. An explicit scheme, on the other hand, requires $r < 1$ for stability. Pearce and Mitchell showed, however, that the basic difference scheme in the implicit approach can lead to large errors in the solution while being stable. They demonstrated that appropriate explicit algorithms are considerably more accurate, although restricted to small time steps. In this paper the authors report a nodal procedure applied to both the temporal and the spatial variables. Nodal Methods, which retain higher order moments of the solution, have been utilized to solve the static transport equation with much larger cell widths than required by the standard differencing schemes to attain the same accuracy.

53872 **Diffusion synthetic acceleration for S_n problems with reflecting boundaries.** Yavuz, M.; Larsen, E.W. *Transactions of the American Nuclear Society (USA),* 56: 305-306 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The Diffusion Synthetic Acceleration (DSA) method has become a widely used numerical algorithm for accelerating the iterative convergence of S_n problems. The primary advantage of DSA is that it produces, for most problems, an iteration error that is reduced by at least two orders of magnitude for every three iterations. However, for problems in which the entire exterior boundary of the physical system is reflecting (such problems occur in modeling a single cell in an infinite lattice), DSA is much more slowly converging, and in some cases, unstable. Here, the authors explain why this occurs and we describe an easily implemented modification of DSA that yield the same rapid rate of convergence for this type of problem as current DSA now exhibits for other types of problems.

53873 **Supercomputer S_N calculations without observable ray effects or numerical diffusion.** Monahan, S.P.; Filippone, W.L. *Transactions of the American Nuclear Society (USA),* 56: 306-307 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

When developed in the 1950s and 1960s, the discrete ordinates method was tailored for optimum efficiency on the computers of the day. Computation speeds and the available memory of those first computers were extremely poor by today's standards. Nevertheless, the S_N algorithm was and continues to be the method of choice for many transport problems. However, S_N calculations have been plaqued by two serious problems: numerical diffusion and ray effects. The first arises form spatial discretization and can be quite severe near flux discontinuities; the second results from angular discretization and is very pronounced for low scattering media. Although the streaming ray (SR) method eliminates the former problem, it does not eliminate the latter. Here the authors sent a new discrete ordinates method specifically designed for today's large-memory vector computers, which sharply reduces numerical diffusion and eliminates observable ray effects. Although applied here to the Spencer-Lewis electron transport equation, it is believed the method would be equally applicable to neutral particle transport.

53874 **A finite-moments algorithm for transport equations in cylindrical geometry.** Badruzzaman, A. *Transactions of the American Nuclear Society (USA),* 56: 307-308 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

A general-order finite-spatial-moments discrete ordinates method, initially developed in one dimension, has recently been extended to x-y-z geometry. The resulting system of equations was shown to contain the nodal transport (S_N) algorithms and the conventional linear diamond scheme as special cases. In many radiation transport problems, cylindrical geometry is more appropriate, and in this paper the authors derive a generalized moments algorithm in this geometry. Although the derivation is similar, curved geometry introduces special caveats that do not exist in Cartesian geometry. A low-order (constant surface flux) nodal method was tested previously in r-Θ-z geometry without achieving much gain over conventional differencing schemes. Preliminary tests in this paper show that at least a linear assumption is needed to achieve substantial gains.

53875 **Stability analysis of fine-mesh rebalance.** Cefus, G.; Larsen, E.W. *Transactions of the American Nuclear Society (USA),* 56: 309-310 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

One of the oldest and most commonly used algorithms for accelerating the iterative convergence of S_n problems is the rebalance method. Although there are many problems for which rebalance accelerates effectively, there are also many problems (typically having scattering ratios c close to unity or optically thick spatial cells) for which it is unstable. Also, the fact that the rebalance method is nonlinear has inhibited previous theoretical attempts to quantify its stability properties. Here the authors describe a Fourier stability analysis of fine-mesh rebalance (FMR) for a special class of S_n problems; numerical experimentation, however, shows that this analysis accurately predicts the stability of FMR over a much larger class of problems.

53876 (GSF-S–24/88) **Simulation of electron tracks in the energy range of 0.01 to 10 keV in water vapour.** Paretzke, H.G. Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Jan 1988. 91p. (In German). Contract EEC BI-6-011-D(B). Order Number DE90711226. Available from NTIS (US Sales Only), PC A05/MF A01.

The primary aim of this study was to develop a numerical program for simulating electron traces in steam for the energy range of 0.01 to 10 keV, and to prove the quality of the simulation by comparing calculations with measurements from current literature. Moreover, the application range of the program was to be shown by means of practical examples. The task could be performed by applying the Platzman method for analyzing experimental data with respect to their necessary consistency with established theoretical knowledge. The differential oscillator strength distribution, major differential ionization cross-sections and cross-sections for excitation and elastic collision were derived. By comparing major integral factors (e.g., W value (Co80)) with calculated results, it was possible to determine, e.g., the secondary electron cross-sections with the help of consistency tests. These derived activation cross-sections were used as the core of a Monte Carlo calculation programme (MOCA 87) for simulating electron trace structures which were evaluated in such a way that various calculation values could be compared critically with values obtained experimentally (e.g., for yields, depth and radial dose curves, micro-dosimetric distribution). On the whole, the programme exhibited sufficient consistency. (orig./HP).

53877 (IAE–4529-3) **Radiation safety of thorium nuclear fuel cycle.** Demin, V.F.; Zakharchenko, I.E.; Tsurikov, D.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). T-17668.

On the basis of theoretical calculations and analysis of existing data on the experience of operation of nuclear power enterprises an attempt is made to estimate the expected radiological health hazards to personnel and population at all stages of thorium nuclear fuel cycle (NFC). The potential radiological hazard of radioactive NFC wastes does not increase during the transfer from uranium-plutonium fuel to uranium-thorium one. 12 refs.; 1 fig.; 6 tabs.

53878 (IAEA-AL–019, pp. 93-117) **Development of intervention levels for the protection of the public in the event of a major nuclear accident - Past, present and future.** Emmerson, B.W. (International Atomic Energy Agency, Vienna (Austria)). International Atomic Energy Agency, Seibersdorf (Austria). Laboratories. 1989. (CONF-8809405–: Consultants' meeting on rapid instrumental

and separation methods for monitoring radionuclides in food and environmental samples, Vienna (Austria), 5-9 Sep 1988). In *Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988.* Order Number DE90603824. Available from NTIS (US Sales Only), PC A10/MF A01 - OSTI; INIS.

Since the mid-1950's nuclear energy has played an increasing role in meeting the world demand for electricity production. Although during this period incidents and accidents have occurred, in most cases their effect was confined to the plant. Three accidents, however, were sufficiently serious as to involve off-site consequences for the public. The experience from each contributed significantly in the development of current emergency response criteria and planning arrangements at the national and international level. This paper summarizes these contributions as they relate to the development of intervention levels for the protection of the public in the event of an accidental release of radioactive materials to the environment. It indicates the various measures taken by those countries that were affected by the release from the Chernobyl accident and reviews the subsequent actions by relevant international organizations to provide more comprehensive guidance on applying the principles of intervention and developing derived levels, particularly those aimed at controlling the consumption of contaminated foodstuffs, or their movement in international trade. Finally, it considers the prospects for developing a more harmonized intervention approach based on the guidance now being completed at the international level. (author). 25 refs, 2 figs, 7 tabs.

Available from NTIS (US Sales Only), PC A10/MF A01 - OSTI; INIS.

Since the beginning of 1988 the governmental programme in Poland of coordinated research in the field of radiological protection is being carried on. This programme, in which over 10 different institutes are involved is called "Radiological Protection and Nuclear Safety" and its actual schedule is foreseen up to 1990. There are over 40 separate projects in this programme which constitute 5 main tasks of this programme: (1) System of continuous radiological monitoring of the country. (2) Assessment of radiological hazard to population from natural and artificial radionuclides in the environment. (3) Nuclear safety and radiological protection of nuclear facilities. (4) Technical means for personal radiological protection and decontamination in case of nuclear accident. (5) Biological and medical problems of radiological protection. 14 figs, 1 tab.

Available from NTIS (US Sales Only), PC A10/MF A01 - OSTI; INIS.

The assessment of any release of radioactivity to the environment is important for the protection of the public health, especially if the released radioactivity can enter the food chain. The assessment demands rapid, reliable and practical techniques for the analysis of various radionuclides. In order to establish a framework for a new Coordinated Research Programme on Rapid Methods, the Agency held a Consultants' Meeting on September 5 to 9 1988 in Vienna. This report has been produced from the deliberations of this meeting.

53883 (INDC(NDS)–221) **IAEA research coordination meeting on X- and gamma-ray standards for detector efficiency calibration, Braunschweig, FRG, 31 May - 2 June 1989. Summary report.** Christmas, P.; Nichols, A.L.; Lemmel, H.D. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. 31p. (CONF-8905218–: IAEA research coordination meeting on X- and gamma-ray standards for detector efficiency calibration, Braunschweig (Germany, F.R.), 31 May - 2 jun 1989). Order Number DE90605298. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The final official meeting of the IAEA Coordinated Research Programme on the Measurement and Evaluation of X- and Gamma-ray Standards for Detector Efficiency Calibration was held in Braunschweig from 31 May to 2 June 1989. Work undertaken by the participants was reviewed in detail, and actions were agreed to resolve specific issues and problems. Initial steps were also made to establish a format and procedure for the preparation by mid-1990 of an IAEA Technical Reports Series booklet; the measurements and recommended data will be listed, and an IAEA data file established for issue to all interested organisations. 53884 (INIS-BR–1679) **Study of a dosimetric methodology for plutonium by means of radiotonicological analysis in urine.** Bellintani, S.A. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). 1988. 111p. (In Portuguese). Order Number DE90606543. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The present study is mainly concerned with an internal individual monitoring program for workers dealing with ^{239}Pu, by measuring the ^{239}Pu content in their urine. General aspects related with the plutonium radiotoxicity and its chemical, physical and metabolic properties are discussed. The methodology chosen for the ^{239}Pu analyses in urine is based on the wet ashing of the urine sample, followed by the plutonium separation by precipitation with lanthanium nitrate and extraction with thenoyltrifluoroacetone. After the separation, the samples is electrodeposited and the activity measured by alpha spectrometry. The results were then analyzed by taking into account the couting efficiency obtained of 23.72%, the chemical recovery of 85.3% and the lower limit of detection of 1.1 x 10^{-3} Bq. Finally, the bases for the establishment of reference levels for urinary excretion are discussed by considering the maximum permissible body burden (MPBB) and the annual limit of intake (ALI). (author).

53886 (DOE/ER/10742–7) **Development of an x-ray beam line at the NSLS for studies in materials science using x-ray absorption spectroscopy: Final report.** Sayers, D.E. North Carolina State Univ., Raleigh, NC (USA). [1989]. 43p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-80ER10742. Order Number DE90001456. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

At the time of the submission of the original proposal more than 7 years ago, the X-11 PRT had set as a goal to develop one of the leading and most comprehensive x-ray absorption beam lines in the world. By any measure we have been successful. As is well documented in previous annual progress report and in the NSLS annual reports, our PRT has been extremely productive in a wide range of topics in materials science, solid state physics, chemistry and biology. Well over 100 papers have been published acknowledging the support of this contract and this continues at a rate of about 30 papers per year and about 20 invited presentations per year. Significant in this report are major studies in high T_c compounds, advances in interface studies, new results in premelting phenomena, several pioneering studies in application of XAS to electrochemistry and significant progress in our understanding of the structure of amorphous chalcogenide systems and their photostructural changes.

53887 (INIS-BR–1626) **Study on effect of substituents in α positron of N,N-diethylamides by nuclear magnetic resonance.** Martins, M.A.P. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1982. 354p. (In Portuguese). Order Number DE90605723. Available from NTIS (US Sales Only), PC A16/MF A01 - OSTI; INIS.

The effect of a substituent in the α position of some N,N-diethylamides, through the ^{1}H and ^{13}C n.m.r. spectroscopy is studied. Eight N,N-diethylamides having the structure: Y-CH_2-C(O) - NEt_2, where Y=H, Me, Cl, Br, I, OMe, SMe, and NMe_2 were prepared by usual procedures; all these compounds were characterized by their ^{1}H and ^{13}C n.m.r. and infrared spectra, as well as by their elementary analysis. (M.J.C.).

53888 (INIS-mf–12006, pp. 35-38) **β-NMR on ^{12}B implanted in metallic single crystals.** Diehl, E.; Dippel, R.; Ergezinger, K.H.; Fischer, B.; Ittermann, B.; Jaeger, E.; Metzner, H.; Seelinger, W.; Sulzer, G.; Ackermann, H. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The β-NMR-technique has been used to determine lattice locations of ^{12}B implanted in single crystals. For the system ^{12}B in vanadium two different sites were investigated separately. The location of ^{12}B in Ni_3Al could be identified combining our results with existing channeling data. (orig.).

Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Feb 1989. (In Japanese). (CONF-8812110–: Specialist research meeting on semiconductors with research reactors, Kumatori (Japan), 12-13 Dec 1988). In *Proceedings of the specialist research meetings on semiconductors with research reactors.* Order Number DE90705930. Available from NTIS (US Sales Only), PC A07/MF A01.

Some topics on the diffusion of impurities in Si and its relations with point defects are discussed. Diffusion of impurities in Si is affected by such factors as the dislocation density, sample thickness and atmosphere, suggesting that defects are involved in the diffusion process. Oxidation stacking faults (OSFs) are produced in oxidized Si due to non-saturation with vacancies or supersaturation with interstitial Si. P and B diffuse faster in an oxidizing atmosphere than in a non-oxidizing atmosphere (oxidation enhanced diffusion: OED) due to supersaturation with point defects involved in their diffusion. The simultaneous occurrence of these processes indicates that the diffusion of P and B involves interstitial Si and proceeds by the interstitialcy mechanism, with the interstitial Si resulting from the oxidation. Compared to this, Sb diffuses more slowly in an oxidizing atmosphere than in a non-oxidizing atmosphere (oxidation retarded diffusion). Equations for the diffusion of vacancies and interstitial Si are derived and discussed. Some results of back-side OED and ORD are cited and discussed. It is insisted that some point defects are freezed when Si is quenched from a high temperature. Some methods for analyzing OED, ORD and OSF are briefly outlined. (N.K.).

53893 (KURRI-TR–312, pp. 55-58) **Irradiation effect on aluminum compounds.** Atobe, Kozo (Naruto Univ. of Education, Tokushima (Japan)). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Feb 1989. (In Japanese). (CONF-8812110–:

Specialist research meeting on semiconductors with research reactors, Kumatori (Japan), 12-13 Dec 1988). In *Proceedings of the specialist research meetings on semiconductors with research reactors.* Order Number DE90705930. Available from NTIS (US Sales Only), PC A07/MF A01.

As to the research on the irradiation damage of insulators, the research on the color center of alkali halide has been carried out for many years. Recently, the insulators which can be used under strong radiation condition have been demanded, and aluminium oxide is considered as one of the condidates. As the typical material, the material of low activation is taken in consideration, and the light elements like Al-Mg-O-N system are used. However, the basic research on the radiation damage of such material has not been sufficiently carried out. In the present experiment, the irradiation with fast neutrons was carried out on the samples of Al_2O_3, spinel ($MgO\text{-}3Al_2O_3$) and AlN, and the effect of irradiation was measured mainly by optical means. As the facilities for the irradiation, those which have the atmosphere of irradiation temperature at which irradiation defects are not annealed were used, and the irradiation atmosphere was helium gas. In Al_2O_3, the efficiency of forming point defects by neutron irradiation was largely different due to irradiation temperature. The recombination of defects and the conversion to compound defects occurred. In the case of spinel, only the absorption band due to F-centers appeared strongly. In AlN, also F-type defects arose. (K.I.).

53894 (KURRI-TR-312, pp. 59-67) **Process of optical excitation and relaxation of color center in synthetic diamond and its application to optoelectronics.** Nishida, Yoshio (Osaka Univ., Toyonaka (Japan). Faculty of Engineering Science). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Feb 1989. (In Japanese). (CONF-8812110--: Specialist research meeting on semiconductors with research reactors, Kumatori (Japan), 12-13 Dec 1988). In *Proceedings of the specialist research meetings on semiconductors with research reactors.* Order Number DE90705930. Available from NTIS (US Sales Only), PC A07/MF A01.

Irradiation of high-pressure synthesized diamond is carried out by using a nuclear reactor or a linac. Then, the effect of annealing on the color centers is observed. A study is made to identify different color centers and to provide techniques to control their introduction. Investigations cover the relation of color center formation with annealing temperature, dependence of color center formation on radiation dose, migration of H3 center and hydrogen, and applicability of five different color centers to optoelectronics. Next, a study is made of the formation and relaxation of the nitrogen vacancy (NV) center in a metastable excited state produced by optical excitation. An optical gain is essential to provide laser. Optical amplification is measured at the vibronic emission band of the NV center. An increase in absorption is detected, indicating that the NV center will not provide laser. In the optical excitation-relaxation process, the relaxation proceeds via a metastable state. Finally, hole burning of ZPL of the NV center is observed in the temperature range from 20K to 80K, and some of its features are described. (N.K.).

53895 (LA-UR-89-3094) **Dynamical properties from quantum Monte Carlo by the Maximum Entropy Method.** Silver, R.N.; Sivia, D.S.; Gubernatis, J.E. Los Alamos National Lab., NM (USA). [1989]. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8908106--2: Los Alamos workshop on quantum simulations of condensed matter phenomena, Los Alamos, NM (USA), 8-11 Aug 1989). Order Number DE90001835. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An outstanding problem in the simulation of condensed matter phenomena is how to obtain dynamical information. We consider the numerical analytic continuation of imaginary time Quantum Monte Carlo data to obtain real frequency spectral functions. We suggest an image reconstruction approach which has been widely applied to data analysis in experimental research, the Maximum Entropy Method (MaxEnt). We report encouraging preliminary results for the Fano-Anderson model of an impurity state in a continuum. The incorporation of additional prior information, such as sum rules and asymptotic behavior, can be expected to significantly improve results. We also compare MaxEnt to alternative methods. 17 refs., 4 figs.

53896 (LA-UR-89-3175) **Optical solitons in liquid crystals.** Yung, Y.S.; Lam, L. Los Alamos National Lab., NM (USA). [1989]. 7p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-8801171--1: Conference on solitons and chaotic behavior in optical systems, San Jose, CA (USA), 6-7 Jan 1988). Order Number DE90000694. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In this paper, we will discuss theoretically the possible existence of optical solitons in the isotropic liquid and in the nematic phase. For the same compound, when heated, the nematic phase will go through a first order transition at temperature T_c to the isotropic liquid phase. As temperature increases from below T_c, the orientation order parameter, Q, decreases, drops to zero abruptly at T_c and remains zero for $T > T_c$. 10 refs., 1 fig.

53897 (LA-UR-89-3249) **General many-body systems.** Trugman, S.A. Los Alamos National Lab., NM (USA). [1989]. 27p. Sponsored by U.S. DOE Energy Research; National Aeronautics and Space Administration; National Science Foundation. DOE Contract W-7405-ENG-36. PHY82-17853. (CONF-8905225--1: NATO advanced summer school on applications of statistical and field theory to condensed matter, Evora (Portugal), May 1989). Order Number DE90000685. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The problem of how to visualize and sometimes solve a general many-body system is considered. The ideas are established in the context of very simple small systems, a Hubbard model and a coupled electron-phonon model, both on two lattice sites. These models are also solved to good approximation in the thermodynamic limit, although the Hubbard model is restricted to a small number of holes away from the Mott insulating state. Response functions are also considered. A fairly general many-body Hamiltonian is considered. It consists of an electron or other fermion kinetic energy and electron-electron interactions, which may be coupled to a bose field such as a phonon. The phonons themselves may be nonlinear (have self-interactions). The system may be strongly coupled. One may also add coupling to an external driving field, such as an ac electric field. The methods discussed are nonperturbative, and so differ from the standard methods of diagrammatic perturbation theory. A comparison is made with diagrammatic methods in the context of the random phase approximation. 6 refs., 12 figs.

53898 (LBL-27694) **Non-linear optical studies of adsorbates: Spectroscopy and dynamics.** Zhu, Xiangdong. Lawrence Berkeley Lab., CA (USA). Aug 1989. 178p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE90001543. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

In the first part of this thesis, we have established a systematic procedure to apply the surface optical second-harmonic generation (SHG) technique to study surface dynamics of adsorbates. In particular, we have developed a novel technique for studies of molecular surface diffusions. In this technique, the laser-induced desorption with two interfering laser beams is used to produce a monolayer grating of adsorbates. The monolayer grating is detected with diffractions of optical SHG. By monitoring the first-order second-harmonic diffraction, we can follow the time evolution of the grating modulation from which we are able to deduce the diffusion constant of the adsorbates on the surface. We have successfully applied this technique to investigate the surface diffusion of CO on Ni(111). The unique advantages of this novel technique will enable us to readily study anisotropy of a surface diffusion with variable grating orientation, and to investigate diffusion processes of a large dynamic range with variable grating spacings. In the second part of this work, we demonstrate that optical infrared-visible sum-frequency generation (SFG) from surfaces can be used as a viable surface vibrational spectroscopic technique. We have successfully recorded the first vibrational spectrum of a monolayer of adsorbates using optical infrared-visible SFG. The qualitative and quantitative correlation of optical SFG with infrared absorption and Raman scattering spectroscopies are examined and experimentally demonstrated. We have further investigated the possibility to use transient infrared-visible SFG to probe vibrational transients and ultrafast relaxations on surfaces. 146 refs.

53899 (ORNL–6571) **Solid State Division: Progress report for period ending March 31, 1989.** Green, P.H.; Watson, D.M. (eds.). Oak Ridge National Lab., TN (USA). Aug 1989. 248p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90000979. Available from NTIS, PC A11/MF A01; OSTI; INIS; GPO Dep.

This report contains brief discussions on work done in the Solid State Division of Oak Ridge National Laboratory. The topics covered are: Theoretical Solid State Physics; Neutron scattering; Physical properties of materials; The synthesis and characterization of materials; Ion beam and laser processing; and Structure of solids and surfaces. (LSP)

53900 (ORNL/FTR–3021) **[Ion implantation of ceramics]: Foreign trip report, August 24–September 10, 1988.** Zinkle, S.J. Oak Ridge National Lab., TN (USA). 19 Sep 1988. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001298. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler attended and presented a paper entitled "Ion Irradiation Studies of Oxide Ceramics" at the NATO Advanced Study Institute on Structure-Property Relationships in Surface-Modified Ceramics. An up-to-date assessment of the property and microstructural changes associated with ion implantation of ceramics was covered at the Institute through a series of invited and contributed papers.

53901 (ORNL/FTR–3384) **[Ion beam deposition research and development program]: Foreign trip report, July 28, 1989–September 17, 1989.** Alton, G.D. Oak Ridge National Lab., TN (USA). 2 Oct 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001249. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report provides a brief summary of the activities engaged in by the traveler while working as a guest scientist at the Harwell Laboratory, Oxfordshire, England. While at Harwell, the traveler initiated a research and development program designed to study the properties of films prepared by the direct deposition of epithermal ion beams of a variety of species (energies: 25 to 500 eV). To accomplish the objective, the traveler designed ion deposition lens systems for an existing circularly-symmetric low-beam-intensity facility and for a two-dimensional, slit-type, high-intensity facility under proposal. A lens for the low-beam-intensity facility was fabricated and used, preliminarily, to prepare thin carbon films. In addition to the projects related to ion beam deposition, the traveler made improvements to the filament lifetimes of the duoplasmatron used in conjunction with the low-beam-intensity system and advised on problems associated with negative ion sources on the 6-MV tandem accelerator.

53902 (RAL–89-046) **ATLAS - analysis of time-of-flight diffraction data from liquid and amorphous samples. Version 1.0.** Soper, A.K.; Howells, W.S.; Hannon, A.C. Rutherford Appleton Lab., Chilton (UK). May 1989. 130p. Order Number DE90605726. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The purpose of this manual is to describe a package of data analysis routines which have been developed at the Rutherford Appleton Laboratory for the analysis of time-of-flight diffraction data from liquids, gases, and amorphous materials. There is no fundamental barrier to diffraction data being accurately analysed to structure factor or even pair correlation function within a very short time of the completion of the experiment. Section 1 describes the time-of-flight neutron diffraction experiment and looks at diffraction theory. Section 2 indicates the steps in data analysis of time-of-flight diffraction data and Section 3 gives details of how to run the procedures. (author).

53903 (RAL–89-057) **Application of the specular reflection of neutrons to the study of surfaces and interfaces.** Penfold, J.; Thomas, R.K. Rutherford Appleton Lab., Chilton (UK). Jun 1989. 72p. Order Number DE90605727. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

A range of phenomena analogous to those observed in classical optics are exhibited by slow neutrons; these include reflection, refraction and interference. Total reflection of slow neutrons has been extensively applied to a range of problems. The specular reflection of neutrons gives information on the neutron refractive index profile normal to an interface. The refractive index is simply related to the scattering length density and hence specular neutron reflection can provide important information about the composition of surfaces and interfaces. Neutrons scattering amplitudes vary randomly from element to element, and isotopic substitution can be used to produce large contrasts in the scattering density. Since some of the early experiments and applications it is only relatively recently that any concerted effort has been made to apply the technique to the wider study of surface and interfacial problems. The theoretical background is discussed, experimental methods described and recent examples of the use of this technique in surface chemistry, surface magnetism and solid films are given. (author).

53904 (SAND–89-0854C) **Near-threshold energy dependence of Xe-induced displacements on Ge(001).** Picraux, S.T.; Brice, D.K.; Horn, K.M.; Tsao, J.Y.; Chason, E. Sandia National Labs., Albuquerque, NM (USA). 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. (CONF-890821–4: 13. international conference on atomic collisions in solids, Aarhus (Denmark), 7-11 Aug 1989). Order Number DE90001176. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Surface displacements due to low energy (100-300 eV) Xe ion bombardment of the Ge(001) 2×1 reconstructed surface are investigated by in situ RHEED measurements of surface roughening. The near-exponential decay in RHEED intensity due to displacements of Ge atoms at the surface is shown to depend sensitively on the Xe energy and flux. Iso-damage rate curves at 100°C are used to establish a fixed amount of defect annealing and to determine the number of surface displacements per Xe as a function of Xe energy. The calculated number of near-surface displacements per Xe exhibits a similar energy dependence. Comparison of experiment and calculation indicates an efficiency for the production of stable surface defects of about 50% at a temperature of 100°C and damage rate of 2×10^{12} displacements/cm^2-sec. Results indicate this approach will allow the threshold energies for surface atom displacements to be measured. 7 refs., 4 figs.

53905 **Advances in laser science–4: Proceedings.** Optical science and engineering series 10. Golf, J.L.; Heller, D.F.; Lapp, M.; Stwalley, W.C. (eds.). 777p. American Institute of Physics, New York, NY (USA) (1989). Sponsored by American Institute of Physics. (CONF-8810399–: 4. advances in laser science, Atlanta, GA (USA), Oct 1988).

This report contains papers on the following main topics: lasers and coherent sources, nonlinear optical phenomena and applications; condensed matter, surfaces, and particle spectroscopy with emphasis on laser-surface interactions; atomic, molecular, and ionic spectroscopy; state-specific photophysics and photochemistry; and diagnostic and analytical applications of lasers. Individual paper will be cataloged separately.

53906 **Control of etching of $LiNbO_3$ by implant damage profile tailoring.** Brannon, P.J. (Sandia National Labs., Albuquerque, NM (USA)); Ashby, C.I.H.; Arnold, G.W. vp of Laser and particle-beam chemical processing for microelectronics. Ehrlich, D.J.; Higashi, G.S.; Oprysko, M.M. Materials Research Society, Pittsburgh, PA (1988). (CONF-8711147–: Laser and particle-beam chemical processing for microelectronics, Boston, MA (USA), 30 Nov - 3 dec 1987).

Damage-profile tailoring using multi-energy ion implants can produce smooth side walls and deeper etched features with ion-bombardment-enhanced wet etching of $LiNbO_3$ than is possible with a single-energy implant. High ion fluences can produce buried microcracks which may contribute to propagation losses commonly observed in ion-implanted waveguides.

53907 **Electron microdiffraction and channeling: Theory and applications.** Kim, Y.O. Thesis (Ph. D.). 200p. Arizona State Univ., Tempe, AZ (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-15,614.

Three related topics in the theory of dynamical kilovolt electron diffraction are treated, and one practical application of the theory is provided. The first topic concerns the theory of coherent electron microdiffraction for atomic clusters and precipitates. The visibility of High Order Laue Zone (HOLZ) lines within the central-beam disk of

coherent electron-microdiffraction patterns was studied using dynamical electron-diffraction theory. The electron source size is also shown to affect HOLZ line visibility. Coherent electron-microdiffraction patterns were obtained from a new crystalline precipitate found in silicon wafers annealed at 635°C for 256 h. The most likely structure is that of keatite (SiO_2, tetragonal). The implications for the study of oxygen precipitation in silicon are discussed. The second theoretical topic concerns the possibilities for determining the sites of adatoms on surfaces by measurements of the x-ray or Auger electron yield as a function of diffraction conditions in the RHEED geometry. Finally, the effects of wave-function dimensionality and inelastic localization on ALCHEMI (Atom Location by Channeling Enhanced Microanalysis) has been studied. The original ALCHEMI equations are shown to hold for certain conditions.

53908 Interpretation of the linear coefficient of surface-plasmon dispersion. Feibelman, P.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185 (US)). *Physical Review [Section] B: Condensed Matter (USA),* 40(5): 2752-2756 (15 Aug 1989). DOE Contract AC04-76DP00789.

Microscopic theory predicts that the fluctuating charge of free-electron-metal surface plasmons will lie in the tail of the metallic electron gas, and that, as a consequence, the linear coefficient of surface-plasmon dispersion will be negative. The latter prediction is interpreted here using the virial theorem. At larger wave vectors the more rapidly attenuating electric field associated with a fluctuating charge that lies outside the bulk of a metal will move fewer electrons. The virial theorem relates this fact to a lower frequency. Were the fluctuating charge to lie inside a metal, then more of its electric field would move electrons as the field attenuation became more rapid. This, according to the virial theorem, would imply a positive dispersion coefficient.

53909 Anisotropic tight-binding model for localization. Li, Q. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)); Soukoulis, C.M.; Economou, E.N.; Grest, G.S. *Physical Review [Section] B: Condensed Matter (USA),* 40(5): 2825-2830 (15 Aug 1989). DOE Contract W-7405-ENG-82.

The anisotropic tight-binding model, which is defined by a disordered tight-binding Hamiltonian with a transfer-energy-matrix element in the z direction, t, different than the one in the x-y plane is studied using finite-size scaling methods. The dependence of the mobility edge on the strength of anisotropy t ($0 \leq t \leq 1$) is obtained for the center of the band, E=0. Even for very low-t values an appreciable amount of disorder is needed to localize the E=0 state. These results are found to be in satisfactory agreement with the predictions of the potential-well analogy, coupled with the coherent-potential approximation.

53910 First-principles calculation of alloy phase diagrams: The renormalized-interaction approach. Ferreira, L.G. (Solar Energy Research Institute, Golden, Colorado 80401 (US)); Wei, S.; Zunger, A. *Physical Review [Section] B: Condensed Matter (USA),* 40(5): 3197-3231 (15 Aug 1989). DOE Contract AC02-77CH00178.

We present a formalism for calculating the temperature-composition phase diagrams of isostructural solid alloys from a microscopic theory of electronic interactions. *First*, the internal energy of the alloy is expanded in a series of volume-dependent multiatom interaction energies. These are determined from self-consistent total-energy calculations on periodic compounds described within the local-density formalism. *Second*, distant-neighbor interactions are renormalized into composition- and volume-dependent effective near-neighbor multisite interactions. *Finally*, approximate solutions to the general Ising model (using the tetrahedron cluster variation method) underlying these effective interactions provide the excess enthalpy ΔH, entropy ΔS, and hence the phase diagram. The method is illustrated for two prototype semiconductor fcc alloys: one with a large size mismatch ($GaAs_xSb_{1-x}$) and one with a small size mismatch ($Al_{1-x}Ga_xAs$), producing excellent agreement with the measured miscibility temperature and excess enthalpies. For lattice-mismatched systems, we find $0 < \Delta H^O < \Delta H^D$, where O denotes some ordered Landau-Lifshitz (LL) structures, and D denotes the disordered phase. We hence predict that such alloys will disproportionate at low-temperature equilibrium into the binary constituents, but if disproportionation is kinetically inhibited, some special ordered phases (i.e., chalcopyrite) will be thermodynamically stabler below a critical temperature than the disordered phase of the same composition. For the lattice-matched systems, we find $0 < \Delta H^O < \Delta H^O$ for all LL structures, so that only a phase-separating behavior is predicted.

53911 First-principles method for calculating electronic properties of layered structures. Rogers III, J.P. (Department of Metallurgical Engineering and Materials Science, Carnegie Mellon University, Pittsburgh, Pennsylvania 15213-3890 (US)); Nelson, J.S.; Cutler, P.H.; Feuchtwang, T.E. *Physical Review [Section] B: Condensed Matter (USA),* 40(6): 3638-3642 (15 Aug 1989).

We present a first-principles, computationally efficient method for calculating the electronic structure of layered systems consisting of simple metals. The method involves forming a one-dimensional, planar-averaged potential from a three-dimensional array of ionic pseudopotentials. As an example of its use, we have calculated the work function, electron density, and effective potential for ultrathin Na, K, and Li films. The calculations, which can be performed on a workstation, show good agreement with experimental results and three-dimensional, self-consistent-field pseudopotential calculations taking several hours of central-processing-unit time on a Cray Research, Inc. supercomputer.

53912 Lattice-dynamical calculation of the Kapitza resistance between fcc lattices. Young, D.A. (Department of Physics, Brown University, Providence, Rhode Island 02912 (US)); Maris, H.J. *Physical Review [Section] B: Condensed Matter (USA),* 40(6): 3685-3693 (15 Aug 1989).

The temperature dependence of the Kapitza resistance (thermal boundary resistance) at the interface between two dissimilar solids is calculated for a model system consisting of two semi-infinite, harmonic fcc lattices in register. The spectral density of phonon flux transmitted across the interface is obtained from a numerical calculation of the phonon transmission coefficient and group velocity and is used to calculate the Kapitza resistance. Results for the spectral density of the transmitted phonon flux, the spectral dependence of the phonon transmission coefficient, and the temperature dependence of the thermal boundary resistance are presented. Calculation of the thermal boundary resistance for real systems using the results of this calculation is discussed.

53913 Real-space multiple-scattering theory and the electronic structure of systems with full or reduced symmetry. Zhang, X. (Department of Physics and Astronomy, Northwestern University, Evanston, Illinois 60201 (US)); Gonis, A.; MacLaren, J.M. *Physical Review [Section] B: Condensed Matter (USA),* 40(6): 3694-3710 (15 Aug 1989). DOE Contract W-7405-ENG-48.

We present a new real-space multiple-scattering-theory method for the solution of the Schrödinger equation and the calculation of the electronic structure of solid materials with full or reduced symmetry. The method is based on the concept of semi-infinite periodicity (SIP), rather than translational invariance, and on the property of removal invariance of the scattering matrix of systems with SIP. This latter property allows one to replace the usual Brillouin-zone integrals in reciprocal space by a self-consistency equation for the t matrix, which is sufficient for the determination of the Green function and related properties. Because it is developed entirely in direct space, the method provides a unified treatment of the electronic structure of bulk materials, surfaces, interfaces and grain boundaries (coherent or incoherent), impurities of interstitial or substitutional kinds, and can be easily extended to treat concentrated, substitutionally disordered alloys. One of its advantages over methods based on Bloch's theorem and reciprocal space is the great simplicity of setting up and running the associated computer codes even for complex structures, and structures with reduced or no symmetry that lie outside the realm of applicability of conventional methods. We present the results of model calculations for one-dimensional and three-dimensional model systems as well as for three-dimensional realistic materials. Where appropriate, these results are compared with those obtained through conventional techniques, and give an indication of the method's flexibility and reliability. Our applications of this method to this point are discussed, and our plans for future development are presented.

53914 **Ma-Brueckner correlation energy.** Kleinman, L. (Department of Physics, University of Texas, Austin, Texas 78712 (US)); Tamura, T. *Physical Review [Section] B: Condensed Matter (USA),* 40(6): 4191-4193 (15 Aug 1989).

We point out that the e^2 dependence of the term in the correlation energy of a high-density electron gas, proportional to the gradient squared of the charge density, was rigorously derived by Ma and Brueckner only for infinitely long-wavelength variations in the charge density. We also correct an error made in obtaining the coefficient of this term which arose because of long-range Coulomb anomalies in the exchange energy which they subtracted from the exchange-correlation energy.

53915 **The influence of an external electric field on the X-ray scattering of 2-methyl-4-nitroaniline, an organic crystal with nonlinear optical properties.** Paturle, A. (State Univ. of New York, Buffalo (USA). Dept. of Chemistry); Graafsma, H.; Boviatsis, J.; Legrand, A.; Restori, R.; Coppens, P.; Kvick, A.; Wing, R.M. *Acta Crystallographica, Section A: Foundations of Crystallography (Denmark),* 45(6): FC25-FC28 (1 Jun 1989). DOE Contract FG02-86ER45231;AC02-76CH00016.

The influence of an electric field on the X-ray scattering of the nonlinear optical organic crystal MNA (2-methyl-4-nitroaniline) has been studied, using a three-step pulsed alternating electric field. The field changes are synchronized with the gating to three different counting chains (the three-step modulation method). A field strength of 39 kV cm^{-1} induces 0.2% maximum variation in the integrated intensity and a small shift in Bragg angles (an inverse piezoelectric effect). A special electron density refinement method, which uses the differences between the zero- and applied-field intensities as observations, has been developed and applied in the interpretation of the results. (orig.).

53916 (ORNL/FTR–3014) **[Theoretical studies on high-temperature superconductivity]: Foreign trip report, August 29, 1987–August 20, 1988.** Stocks, G.M. Oak Ridge National Lab., TN (USA). 5 Sep 1988. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001297. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report covers a one-year assignment to the University of Bristol. While at Bristol I worked on the calculation of the electronic structure and ground state properties of the new class of high-temperature superconducting materials. I also worked on the development of a new code to calculate the electronic structure and ground state properties of disordered systems (alloys, nonstoichiometric, and alloyed high-temperature superconducting materials) that have more than one atom per unit cell. I also initiated work to study the possibility of obtaining superconductivity within the Hubbard model.

53917 **Kim model for magnetization of type-II superconductors.** Chen, D. (Electromagnetic Technology Division, National Institute of Standards and Technology, Boulder, Colorado 80303 (US)); Goldfarb, R.B. *Journal of Applied Physics (USA),* 66(6): 2489-2500 (15 Sep 1989).

We have calculated the initial magnetization curves and complete hysteresis loops for hard type-II superconductors. The critical-current density J_c is assumed to be a function of the internal magnetic field H_i according to Kim's model, $J_c(H_i)=k/(H_0+|H_i|)$, where k and H_0 are constants. As is the case for other critical-state models, additional assumptions are that bulk supercurrent densities are equal to J_c, and that the lower critical field is zero. Our analytic solution is for an infinite orthorhombic specimen with finite rectangular cross section, $2a\times2b$ ($a\leq b$), in which a uniform field H is applied parallel to the infinite axis. Assuming equal flux penetration from the sides, we reduced the two-dimensional problem to a one-dimensional calculation. The calculated curves are functions of b/a, a dimensionless parameter $p=(2ka)^{1/2}/H_0$, and the maximum applied field H_m. The field for full penetration is $H_p=H_0[(1+p^2)^{1/2}-1]$. A related parameter is $H^*_m=H_0[(1+2p^2)^{1/2}-1]$. Hysteresis loops were calculated for the different ranges of H_m : $H_m<H_p$, $H_p<H_m<H^*_m$, and $H^*_m<H_m$. The equations for an infinite cylindrical specimen of radius a are the same as those for a specimen with square cross section, $a=b$.

53921 (ISN–89-19) **Second RPA dynamics at finite temperature: time-evolutions of dynamical operators.** Jang, S. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Jan 1989. 46p. Order Number DE90713763. Available from NTIS (US Sales Only), PC A03/MF A01.

Time-evolutions of dynamical operators, in particular the generalized density matrix comprising both diagonal and off-diagonal elements, are investigated within the framework of second RPA dynamics at finite temperature. The calculation of the density matrix previously carried out through the appliance of the second RPA master equation by retaining only the slowly oscillating coupling terms is extended to include in the interaction Hamiltonian both the rapidly and slowly oscillating coupling terms. The extended second RPA master equation, thereby formulated without making use of the so-called resonant approximation, is analytically solved and a closed expression for the generalized density matrix is extracted. We provide illustrative examples of the generalized density matrix for various specific initial conditions. We turn particularly our attention to the Poisson distribution type of initial condition for which we deduce specifically a particular form of the density matrix from the solution of the Fokker-Planck equation for the coherent state representation. The relation of the Fokker-Planck equation to the second RPA master equation and its properties are briefly discussed. The oversight incurred in the time-evolution of operators by the resonant approximation is elucidated. The first and second moments of collective coordinates are also computed in relation to the expectation value of various dynamical operators involved in the extended master equation.

53922 (LAPP-TH–224-88) **Ward identities for conformal models.** Lazzarini, S.; Stora, R. Grenoble-1 Univ., 74 - Annecy

(France). Lab. de Physique des Particules. 1988. 4p. (CONF-8802155–: 4. Meeting between French and German Physicists and Mathematicians, Marseille (France), 29 Feb - 4 mar 1988). Order Number DE90713787. Available from NTIS (US Sales Only), PC A02/MF A01.

Ward identities which express the symmetry of conformal models are treated. Diffeomorphism invariance or locally holomorphic coordinate transformations are used. Diffeomorphism invariance is then understood in terms of Riemannian geometry. Two different sets of Ward identities expressing diffeomorphism invariance in a conformally invariant way are found for the free bosonic string. Using a geometrical argument, the correct invariance for a large class of conformal models is given.

53923 (LA-UR–89-1664) **Chaotic behavior in nonlinear polarization dynamics.** David, D.; Holm, D.D.; Tratnik, M.V. Los Alamos National Lab., NM (USA). [1989]. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-891151–1: Nearly integrable systems and applications, Minneapolis, MN (USA), 7-11 Nov 1989). Order Number DE89013453. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We analyze the problem of two counterpropagating optical laser beams in a slightly nonlinear medium from the point of view of Hamiltonian systems; the one-beam subproblem is also investigated as a special case. We are interested in these systems as integrable dynamical systems which undergo chaotic behavior under various types of perturbations. The phase space for the two-beam problem is $C^2 \times C^2$ when we restricted the the regime of travelling-wave solutions. We use the method of reduction for Hamiltonian systems invariant under one-parameter symmetry groups to demonstrate that the phase space reduces to the two-sphere S^2 and is therefore completely integrable. The phase portraits of the system are classified and we also determine the bifurcations that modify these portraits; some new degenerate bifurcations are presented in this context. Finally, we introduce various physically relevant perturbations and use the Melnikov method to prove that horseshoe chaos and Arnold diffusion occur as consequences of these perturbations. 10 refs., 7 figs., 1 tab.

53924 Reduction of a wave packet in quantum Brownian motion. Unruh, W.G. (Canadian Institute for Advanced Research, Cosmology Program, Department of Physics, University of British Columbia, Vancouver, British Columbia, Canada V6T 1W5 (CA)); Zurek, W.H. *Physical Review [Section] D: Particles and Fields (USA),* 40(4): 1071-1094 (15 Aug 1989).

The effect of the environment on a quantum system is studied on an exactly solvable model: a harmonic oscillator interacting with a one-dimensional massless scalar field. We show that in an open quantum system, dissipation can cause decorrelation on a time scale significantly shorter than the relaxation time which characterizes the approach of the system to thermodynamic equilibrium. In particular, we demonstrate that the density matrix decays rapidly toward a mixture of "approximate eigenstates" of the "pointer observable," which commutes with the system-environment interaction Hamiltonian. This observable can be regarded as continuously, if inaccurately, monitored by the scalar field environment. Both because in a harmonic oscillator the state of the system rotates in the phase space and because the effective environment "measurement" is weak, the system, on the short "collision" time scale ($1/\Gamma$), maintains a coherence in this pointer observable on time scales of order $[\gamma/\Omega \ln(\Gamma/\Omega)]^{1/2}$ and on longer time scales settles into a mixture of coherent states with a dispersion approximately consistent with the vacuum state. The master equation satisfied by the exact solution differs from the other master equations derived both for the high-temperature limit and for $T=0$. We discuss these differences and study the transition region between the high- and low-temperature regimes. We also consider the behavior of the system in the short-time "transient" regime. For $T=0$, we find that, in the long-time limit, the system behaves as if it were subject to "1/*f* noise." The generality of our model is considered and its predictions are compared with previous treatments of related problems. Some of the possible applications of the results to experimentally realizable situations are outlined.

53925 Steady-state and transient eddy current predictions using surface impedances in shell structures. Davey, K. (School of Electrical Engineering, Georgia Institute of Technology, Atlanta, Georgia 30332-0250 (US)); Turner, L. *Journal of Applied Physics (USA),* 66(6): 2501-2507 (15 Sep 1989).

Surface impedance techniques are useful means of predicting fields in eddy current problems since they circumvent the need to model the conducting regions themselves. Thus, with their use, two- and three-dimensional field predictions can be made using only scalar potentials. Their use is normally confined to (1) problems where the skin depth is small relative to the other dimensions of the problem and (2) steady-state problems where the skin depth itself is well defined. In this regard, the technique is approximate at best. Presented here is a formulation which can realize an exact prediction of the field, both in steady-state and transient problems. The technique is exact for those problems where knowledge is known as to the nature of the field variation tangential to the conductor shell interface; otherwise, an iterative numerical scheme must be employed to converge on the correct tangential variation. Surface impedances are determined generically and expressed in terms of transfer functions for shell-type structures in three different geometries. The surface impedances happen to be trigometric functions, Bessel functions, and spherical Bessel functions in planar, cylindrical, and spherical shell structures, respectively. Their use is easily implemented in finite difference, finite element, and boundary integral formulations; in this paper, the surface impedances are coupled into a boundary integral approach to verify their use in both two-dimensional cylindrical and a three-dimensional spherical problem. The results are compared to analytical expressions and are shown to disagree by no more than 0.01%.

70 FUSION ENERGY

53926 (ORNL/FTR–3413) **[Penetration of charged particles in matter]: Foreign trip report, September 1, 1989–September 28, 1989.** Ritchie, R.H. Oak Ridge National Lab., TN (USA). 12 Oct 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001592. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report covers the activities of the traveler while attending The 12th Werner Brandt International Conference on the Penetration of Charged Particles in Matter held in San Sebastian, Spain, on September 4-7, 1989. The traveler participated in the workshop, interacted with scientists from Spain, Japan, and other countries, and took part in new and continuing collaborations. An important development was reported for the first time anywhere concerning anomalously high events for collision-induced fusion by clusters of heavy water on heavy water-saturated targets. The traveler devised a theoretical model to explain these results. Collaborative work on a monograph with two Spanish colleagues was carried out.

53927 (UCID–21809) **LLNL [Lawrence Livermore National Laboratory] research on cold fusion.** Thomassen, K.I.; Holzrichter, J.F. (eds.). Lawrence Livermore National Lab., CA (USA). 14 Sep 1989. 70p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE90000930. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

With the appearance of reports on "Cold Fusion," scientists at the Lawrence Livermore National Laboratory (LLNL) began a series of increasingly sophisticated experiments and calculations to explain these phenomena. These experiments can be categorized as follows: (a) simple experiments to replicate the Utah results, (b) more sophisticated experiments to place lower bounds on the generation of heat and production of nuclear products, (c) a collaboration with Texas A&M University to analyze electrodes and electrolytes for fusion by-products in a cell producing 10% excess heat (we found no by-products), and (d) attempts to replicate the Frascati experiment that first found neutron bursts when high-pressure deuterium gas in a cylinder with Ti chips was temperature-cycled. We failed in categories (a) and (b) to replicate either the Pons/Fleischmann or the Jones phenomena. We have seen phenomena similar to the Frascati results, (d) but these low-level burst signals may not be coming

from neutrons generated in the Ti chips. Summaries of our experiments are described in Section II, as is a theoretical effort based on cosmic ray muons to describe low-level neutron production. Details of the experimental groups' work are contained in the six appendices. At LLNL, independent teams were spontaneously formed in response to the early announcements on cold fusion. This report's format follows this organization.

53928 (CNIC–00206) **Multijunction grill and its application on lower hybrid current drive experiments.** Jiang Tongwen; Liu Yuexiu; Wu Guiping; Zhang Xuelei. China Nuclear Information Centre, Beijing, BJ (China). May 1988. 8p. Order Number DE90603238. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

A new kind of lower hybrid wave launching structing-multijunction grill has been developed. In this new launcher the RF power is divided by means of an E-plane of rectangle waveguid and the phase difference of adjacent is obtained by a suitable length of the dielectric teflon inserted into corresponding waveguides. Lower hybrid current drive experiments have been successfully performed in HT-6M Tokamak with this multijunction grill. A driven efficiency eta_{CD} up to 0.55 ($10^{13}cm^{-3}$ center dotmcenter dotkA/kW) has been obtained. The influence of LHCD on MHD behaviour of plasma has been clearly observed too, though the RF power coupled to plasma is very low.

53929 (CONF-891007–13) **Transport studies of compact torsatron reactors.** Painter, S.L.; Lyon, J.F. Oak Ridge National Lab., TN (USA). 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001353. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

An efficient transport survey code utilizing the spectral collocation method was developed and is being used to study ignition in low-aspect-ratio torsatron reactors. Using a transport model dominated by helical-ripple-induced neoclassical heat fluxes, it is shown that ignition is possible for a range of radial electric fields and plasma aspect ratios even when the loss of trapped alpha particles is considered. However, control of the density profile near the plasma boundary is necessary. The sensitivity of the results to anomalous electron transport is also considered. Some initial investigations on the role played by "off-diagonal" terms in the neoclassical transport matrix in determining reactor performance are also presented, and a potentially attractive operating regime is found when these additional terms are considered. 9 refs., 5 figs.

53930 (DOE/ER/52127–60) **CTR plasma engineering studies: Annual progress report, December 1, 1988–November 30, 1989.** Miley, G.H. Illinois Univ., Urbana, IL (USA). Fusion Studies Lab. [1989]. 123p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER52127. Order Number DE90001226. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

This report discusses the following topics: ash control in tokamak plasma using induced fishbones; application of controlled sawtooth operation to ash control; and high energy ion transport.

53931 (DOE/ER/53223–113) **Plasma properties: Annual report, January 1, 1988–December 31, 1988.** Weitzner, H. New York Univ., NY (USA). Magneto-Fluid Dynamics Div. Aug 1989. 33p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER53223. Order Number DE90001113. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A cursory examination of the research activities of the Magneto-Fluid Dynamics Division for the calendar year 1988 shows the effects of the gradual transformation of the group. Although our principal activity, fusion plasma physics research, is unchanged, the work shows closer ties to problems relevant to present experiments than previously. Most notable is the concentrated effort on tokamak equilibrium and transport. We are exploring the implication of turbulence induced transport, resistive MHD effects, neoclassical transport, and possible interpretations of transport based on classical phenomena. In addition, one of our members has chosen to focus on problems of enhanced statistical methods for interpretation of experiments. All of this activity preceded the Tokamak Transport Initiative and reflects our active involvement and concern with the world-wide tokamak program. Since equilibrium and transport are by no means the only theoretical plasma physics problems affecting fusion devices we continue substantial efforts in wave propagation and heating, particle simulation of plasmas, stability theory, enhancement of numerical algorithms, and general plasma physics. We are attempting to develop effective numerical schemes for the Boltzmann equation, adaptive grid methods for MHD, and particle simulation of boundary and antenna effects. Many of these topics reflect our continuing concern to maintain a modest effort in the development of theoretical models and tools for problems of real significance to fusion, but not necessarily of immediate highest priority. We select problems which we expect to become extremely important in the future. Our space plasma physics activities, funded by agencies other than DOE, transfers knowledge learned in fusion plasma physics to another area and conversely stimulates work also relevant to fusion problems.

53932 (DOE/ET/51013–275) **Ion collection by probing objects in flowing magnetized plasmas.** Kyu-Sun, Chung. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Apr 1989. 196p. Sponsored by U.S. DOE Energy Research; Korea Science and Engineering Foundation. DOE Contract AC02-78ET51013. (PFC/RR–89-13). Order Number DE90001711. Available from NTIS, PC A09/MF A01; OSTI; INIS; GPO Dep.

A new one-dimensional collisionless kinetic model is developed for the flow of ions to probing structures in drifting plasmas. The cross-field flow into the presheath is modelled by accounting consistently for particle exchange between the collection flux tube and the outer plasma. Numerical solutions of the self-consistent plasma/sheath equations are obtained with arbitrary external ion temperature and parallel plasma flow velocity. Results are presented of the spatial dependence of the ion distribution function as well as its moments (density, particle flux, temperature, and power flux). The ion current to the probe is obtained and the ratio of the upstream to downstream currents is found to be well represented by the form $R = \exp[Ku_d]$, where $K = 1.66$ for $T_i = T_e$ and u_d is the drift velocity in units of $(T_e/m_i)^{1/2}$. The results agree well with comparable recent fluid calculations but show substantial deviations from other models which ignore particle exchange out of the presheath. No evidence is found of the formation of shocks in the downstream wake, contrary to the implications of some fluid theories. We have also extended the previous kinetic model by generalizing cross-field transport and adding ionization to the source of the Boltzmann equation along the presheath. Ion sheath current density and ratio(R) of upstream to downstream current are obtained as a function of plasma drift velocity, equivalent viscosity, ion temperature, and ionization rate. Constants(K) in the form $R = \exp[Ku_d]$ are obtained in terms of viscosity, ion temperature, and ionization rate. The effect of an electrical bias applied to the object on the presheath characteristics is discussed.

53933 (ESA-SP–285-VOL-1, pp. 385-389) **Simulation of electrostatic ion instabilities in the presence of parallel currents and transverse electric fields.** Nishikawa, K.I. (Naval Research Lab., Washington, DC (USA)); Ganguli, G.; Lee, Y.C.; Palmadesso, P.J. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94475;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Plasma Astrophysics, volume 1.* Available from NTIS, PC A18/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

A spatially two-dimensional electrostatic PIC simulation code was used to study the stability of a plasma equilibrium characterized by a localized transverse dc electric field and a field-aligned drift for L is much less than Lx, where Lx is the simulation length in the x direction and L is the scale length associated with the dc electric field. It is found that the dc electric field and the field-aligned current can together play a synergistic role to enable the excitation of electrostatic waves even when the threshold values of the field aligned

drift and the E x B drift are individually subcritical. The simulation results show that the growing ion waves are associated with small vortices in the linear stage, which evolve to the nonlinear stage dominated by larger vortices with lower frequencies.

53934 (ESA-SP–285-VOL-2, pp. 55-60) **Magnetic reconnection simulation using the 2.5 D electromagnetic direct implicit code AVANTI.** Hewett, D.W.; Francis, G.E.; Max, C.E. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94476;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Reconnection in Space Plasma, volume 2.* Available from NTIS, PC A15/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The 2.5 D electromagnetic code AVANTI is outlined. The code runs stably with arbitrarily large Delta t and is quite robust with respect to large fluctuations occurring due to small numbers of particles per cell. The code shows that the reconnection process occurs in distinct stages: (1) early spontaneous reconnection fed by the free energy of an initial anisotropy in the electron component; (2) coalescence of the resulting small-scale filaments of electron current, accompanied by electron jetting; and (3) oscillatory flow of electrons through the magnetic X-point, superposed on continuing nonlinear growth of ion-mediated reconnection. The time evolution of stage 3 is strongly dependent on Mi/Me.

53935 (ESA-SP–285-VOL-2, pp. 61-66) **Kinetic simulation of magnetic reconnection in the presence of shear.** Francis, G.E.; Hewett, D.W.; Max, C.E. European Space Agency, 75 - Paris (France). Jan 1989. (ETN–89-94476;CONF-8809173–: International workshop on reconnection in space plasma, Potsdam (German Democratic Republic), 5-9 Sep 1988). In *Proceedings of an International School and Workshop on Reconnection in Space Plasma, volume 2.* Available from NTIS, PC A15/MF A01; ESA Publications Div., ESTEC, Noordwijk, Netherlands, 45 US dollars or 80 Dutch guilders.

The basic physical processes associated with collisionless magnetic reconnection are investigated using the implicit PIC code AVANTI. The code is based on a 2.5-D fully electromagnetic direct implicit algorithm which proved stable for arbitrary time step. This stability makes it possible to separate out the respective roles of the highly magnetized electron and the unmagnetized ions for large ion-electron mass ratios. It is found that the inclusion of a guide magnetic field (magnetic shear) severely slows the initial stages of reconnection and damps out the electrostatic ringing if local values of the guide field are above a threshold determined by questions of electron mobility.

53936 (GA-A–19546) **Assessment of possible high-energy neutral beam injection in DIII-D.** Bhadra, D.K.; Kim, J. General Atomics, San Diego, CA (USA). Oct 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114. (CONF-891007–18: 13. international symposium on fusion engineering, Knoxville, TN (USA), 2-6 Oct 1989). Order Number DE90001654. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The feasibility of injecting high energy neutral particle beam in the DIII-D tokamak is examined. From numerical calculations of beam deposition, beam losses, and current drive, it is concluded that neutral beam injection up to an energy of 300 to 500 keV is viable. The effect of multistep excitation processes on the enhancement of the ionization cross-section of the energetic neutral particles works out to be beneficial for such a possible experiment. The knowledge obtained from such experiments would be essential for design, planning, and success for future large tokamak devices that will employ negative-ion based, high energy neutral beam injectors. 5 refs., 7 figs., 1 tab.

53937 (GA-A–19826) **Neoclassical transport induced by ICRF [ion-cyclotron range of frequencies] in the collisional regime.** Chiu, S.C.; Chan, V.S. General Atomics Co., San Diego, CA (USA). Sep 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER53277. (CONF-8910225–1: IAEA technical committee meeting on ICRH/edge physics, Munich (Germany, F.R.), 2-5 Oct 1989). Order Number DE90000755. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

From the gyrokinetic equations, a quasilinear equation can be derived with rf effects included in the quasilinear operator. From this, generalized moment equations can be deduced in the guiding center approximation. Of particular interest is the parallel momentum equation which drives the neoclassical transport. The parallel rf forces which can be due to nonresonant or resonant ponderomotive forces are quite different between electrons and ions so that an electrostatic electric field is established. This electric field can influence transport near the plasma edge. We estimate the neoclassical particle and energy fluxes in the Pfirsch-Schlueter regime appropriate for the edge region. Since rf can generate asymmetric momentum and heat sources, it changes the transport in rf heated plasmas and also offers the possibility of externally controlling the density and confinement properties of a tokamak plasma. These effects are discussed in terms of antenna near fields and power requirements. Effects on limiter and divertor discharges will be discussed. 15 refs., 1 fig.

53938 (GTFR–92) **Evaluation of different control methods for the thermal stability of ITER [International Thermonuclear Experimental Reactor].** Mandrekas, J.; Stacey, W.M. Georgia Inst. of Tech., Atlanta, GA (USA). Sep 1989. 45p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER52141. Order Number DE90001580. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A 0-D, time-dependent, particle and power balance code has been developed and used to evaluate the effectiveness of different burn control methods for the stabilization of unstable ignited and sub-ignited operating points of the ITER Physics Phase machine. Based on the results of our calculations, we conclude that operation of ITER at thermally unstable operating points is physically and technologically feasible. Control with auxiliary power modulation seems to be the method of choice for the control of sub-ignited unstable points, while other methods such as modulation of the fueling rate and high-Z impurity injection can also be used, specially for the control of unstable ignited points where auxiliary power modulation cannot be used. 41 refs., 18 figs., 4 tabs.

53939 (IPP–6/278) **Radiofrequency plasma heating and current drive.** Canobbio, E.; Croci, R. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.). Nov 1988. 70p. Available from Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.).

The mechanisms underlying radiofrequency plasma heating and current drive in closed configurations are considered together with the theoretical tools describing them, with just a brief mention of the actual experiments. The heating schemes of interest for thermonuclear devices span a wide range of frequencies form the Alfven wave resonance to the ion-cyclotron, lower hybrid and electron-cyclotron resonances. Heating at frequencies below the Alfven wave resonance (magnetic pumping in its numerous versions), which is of limited thermonuclear relevance, is presented for its fundamental aspects - more than any other heating scheme it involves properties of particle motion in the large which are specific to the magnetic traps - in order to provide a broader and more integrated view of the whole subject. (orig./AH).

53940 (IPPJ–905) **Extension of stellarator approximation in magnetohydrodynamic equilibrium and stability of toroidal helical systems.** Todoroki, Jiro. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 33p. Order Number DE90709986. Available from NTIS (US Sales Only), PC A03/MF A01.

Formulation is made to solve three dimensional MHD equilibrium problem on the basis of the coordinate transformation. The three dimensional problem is divided into three steps: (1) the hyperbolic equations to determine the coordinate transformation, (2) averaged equation in two dimension, and (3) the three dimensional elliptic equation to deal with magnetic potential. The usual stellarator approximation or averaging method is regarded as the first step of the iteration procedure to get the solution of the full three dimensional problems. In formulating linear stability problem, the stellarator ordering is required; the resonance effect should be omitted in the averaging formulation. Some comparison is made to check the validity of the above formulation. (author).

53941 (IPPJ–906) **Role of edge magnetic shear on the limiter H-mode transition of the JIPP T-IIU tokamak.** Toi, K.;

Kawahata, K.; Morita, S. and others. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 16p. Order Number DE90709985. Available from NTIS (US Sales Only), PC A03/MF A01.

In a circular cross-section plasma bounded by a limiter, the H-mode transition is triggered by rapid ramp-down in a plasma current during additional heating, even in the case that the edge electron temperature decays gradually prior to the transition. This result suggests that the enhancement of a magnetic shear near the plasma edge by the ramp-down plays a crucial role on the transition, and that the transition in a limiter-bounded plasma is essentially governed by the current density profile near the edge. (author).

53942 (IPPJ–907) **ECH plasma for different magnetic axis positions and initial ICRF plasma production experiments in CHS.** Okamura, S.; Fujiwara, M.; Hosokawa, M. and others. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 22p. Order Number DE90709984. Available from NTIS (US Sales Only), PC A03/MF A01.

Electron cyclotron heating (ECH) experiments were performed in Compact Helical System (CHS) for three typical magnetic field configurations which correspond to different magnetic axis positions. The obtained electron temperatures are different for these configurations as well as the shapes of temperature and density profiles. The inward shifted configuration was better in that both the central temperature and the total energy are higher than the outward shifted case. ICRF heating with the Type-III antenna and/or the poloidal antenna produced a plasma for wide range of magnetic field strength. (author).

53943 (IPPJ–908) **Experimental study on the deposition profile of the ICRF power and electron thermal diffusivity.** Ogawa, Y.; Ando, R.; Kako, E. and others. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 26p. Order Number DE90709983. Available from NTIS (US Sales Only), PC A03/MF A01.

IN ICRF heating experiments the deposition profile in electrons has been derived experimentally, and comparison with theory has been performed. It is found that the deposition profile is relatively broad ($P_{rf,e}(r) = P_{rf,e}(0)(1-(r/a)^2)^k$ with k = 1.8), and this is interpreted in terms of characteristics of the mode-converted Ion Bernstein Wave. The distribution of the rf power to each species (electrons, hydrogen and deuterium ions) is in good agreement with theoretical predictions. With the deposition profile experimentally obtained, the electron thermal diffusivity x_e has been calculated, resulting in $x_e \sim 0.65$ m^2/s at n-bar$_e$ = 9 x 10^{19} m^{-3}. (author).

53944 (IPPJ–909) **Improved confinement regimes in JIPP T-IIU.** Watari, T.; Kumazawa, R.; Toi, K. and others. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 40p. Order Number DE90709988. Available from NTIS (US Sales Only), PC A03/MF A01.

The H-mode, an improved confinement regime, has been observed recently in JIPP T-IIU high power heating experiments. It was obtained in a limiter configuration without any shaping of the plasma cross-section. This H-mode is not common because it is obtained with ICRF heating. The H-mode is also obtained in a combined heating with NBI and ICRF and it is found that the threshold power level is similar to that of averaged ICRF heating. The power threshold of the H-mode is then studied for its dependence on various plasma parameters: It increases with plasma current, insensitive to plasma density, and optimized against toroidal field intensity. The power deposition profile of ICRF heating is analyzed using a ray-tracing code, and used to explain the observed B_T dependence. This paper also deals with a class of strange shots observed in the same series of experiments. They appeared at a power level close to the H-mode threshold with a remarkable improvement of confinement. However, they are different from the H-mode in the time evolution of the profiles. (author).

53945 (IPPJ–910) **Stochasticity and symmetry of the standard map.** Ichikawa, Y.H.; Kamimura, T.; Hatori, T.; Kim, S.Y. Nagoya Univ. (Japan). Inst. of Plasma Physics. Apr 1989. 37p. Order Number DE90709987. Available from NTIS (US Sales Only), PC A03/MF A01.

The stochasticity and symmetry of the standard map have been discussed to explore the generic aspect of the statistical properties inherent to the low dimensional classical Hamiltonian systems. The accelerator modes of the standard map give rise to anomalous enhancement of the stochastic diffusion. Systematic analysis of symmetry of the standard map is undertaken to investigate structure of the periodic orbits around the stable fixed point, and the method is applied to the Poincare-Birkhoff chains around the accelerator mode. The squeeze effect of the period-3 accelerator orbits is examined explicitly, in terms of the reduced accelerator mode map. Furthermore, it is shown that the period-3 accerator orbits are born as intrinsic nonlinear multifurcation, differing from birth of the Poincare-Birhoff chains with the higher periodicity $q \geq 4$. (author).

53946 (IPPJ–911) **Chaotic magnetic field line in toroidal plasmas.** Hatori, Tadatsugu; Abe, Yoshihiko; Urata, Kazuhiro; Irie, Haruyuki. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 63p. Order Number DE90710052. Available from NTIS (US Sales Only), PC A04/MF A01.

This is an introductory review of chaotic magnetic field line in plasmas, together with some new results, with emphasis on the long-time tail and the fractional Brownian motion of the magnetic field line. The chaotic magnetic field line in toroidal plasmas is a typical chaotic phenomena in the Hamiltonian dynamical systems. The onset of stochasticity induced by a major magnetic perturbation is thought to cause a macroscopic rapid phenomena called the current disruption in the tokamak discharges. Numerical simulations on the basis of magnetohydrodynamics reveal in fact the disruptive phenomena. Some dynamical models which include the area-preserving mapping such as the standard mapping, and the two-wave Hamiltonian system can model the stochastic magnetic field. Theoretical results with use of the functional integral representation are given regarding the long-time tail on the basis of the radial twist mapping. It is shown that application of renormalization group technique to chaotic orbit in the two-wave Hamiltonian system proves decay of the velocity autocorrelation function with the power law. Some new numerical results are presented which supports these theoretical results. (author).

53947 (IPPJ–912) **Full consistent analysis of high beta steady state tokamaks sustained by beam driven and bootstrap currents.** Okano, K.; Ogawa, Y.; Naitou, H. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 45p. Order Number DE90710053. Available from NTIS (US Sales Only), PC A03/MF A01.

Beam driven steady state tokamaks of moderate size (R_0 = 4.55 m) is analyzed by a full consistent beam current drive analysis code, which consistently includes MHD equilibrium, kink and ballooning stability analysis, bootstrap current, power balance and momentum balance calculations. It was found that this moderate size is sufficient to demonstrate the feasibility of steady state operation by the neutral beam current drive. The maximum Q value attains Q = 7~9 with the fusion power P_f = 500~800 MW and L-mode confinement is sufficient to sustain self consistent equilibria. The Q value is nearly doubled due to the bootstrap current and the $T_i > T_e$ feature of beam driven tokamaks. The optimum beam energy is 1.0~1.2 MeV and the toroidal rotation effects has been negligible. (author).

53948 (IPPJ–913) **Improved confinement in high density ohmic discharge in JIPP T-IIU.** Hamada, Y.; Sakamoto, M.; Sato, K.N. and others. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 12p. Order Number DE90710054. Available from NTIS (US Sales Only), PC A03/MF A01.

The improvement of the confinement of the ohmic plasma with limiter configuration, similar to the improved ohmic confinement (IOC) mode of ASDEX, is observed in JIPP T-IIU. The features of our IOC mode are summarized in the following way. (1) the circular limiter-plasma instead of the divertor plasma, (2) very high density threshold for IOC in contrast to the ASDEX IOC mode. (3) no enhanced radiation due to impurity accumulation. The preliminary experimental results are discussed. (author).

53949 (IPPJ–914). **Effect of a converter electrode in a multicusp negative ion source.** Ramos, H.J.; Sasao, Mamiko; Yamaoka, Hitoshi; Wada, Motoi. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 17p. Order Number DE90710055. Available from NTIS (US Sales Only), PC A03/MF A01.

The electron temperature of a negative ion source has to be low so as not to destroy produced negative ions by electron impact processes. The bulk plasma characteristics of a multicusp negative ion source with a converter electrode are examined by a probe data acquisition system for two cases; converter with cesium and converter without cesium. The effects of the converter bias on bulk plasma parameters have been observed when cesium is not introduced. Under cesiated discharge condition, the converter bias effects are obscure. The addition of cesium into a helium discharge decreases the high energy electron component, which is unfavorable from a view point of negative ion extraction, and hence lowers the electron temperature. (author).

53950 (IPPJ–915) **New method of testing nuclear fusion in metals.** Itoh, Noriaki. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 5p. Order Number DE90710056. Available from NTIS (US Sales Only), PC A02/MF A01.

A new crucial test for nuclear fusion in palladium or titanium metal is suggested. This method is capable to heat a deuterium-metal mixture to a given temperature, and hence is expected to yield detailed information on fusion reactions in metallic environments. (author).

53951 (IPPJ-DT–148) **Orbit calculation for heavy ion beam probe system on JIPPT-IIU.** Fujita, Hideki; Hamada, Yasuzi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. 17p. (In Japanese). Order Number DE90709993. Available from NTIS (US Sales Only), PC A03/MF A01.

This is a report of orbit calculation for heavy ion beam probe system which is designed to measure radial and poloidal wave numbers of density and potential fluctuations in the JIPPT-IIU plasma. Multi-channel detectors are adopted in energy analyzer to measure fluctuations at multiple points in the plasma simultaneously. (author).

53952 (IPPJ-T–39) **New method for measuring phase shift in heterodyne interferometric measurement.** Bi, D.G.; Kubo, S.; Nishizawa, A.; Takahashi, C.; Fujita, J. Nagoya Univ. (Japan). Inst. of Plasma Physics. May 1989. 31p. Order Number DE90710051. Available from NTIS (US Sales Only), PC A03/MF A01.

A new method for analysing the phase shift of heterodyne interferometric beat is developed. The phase shift is obtained directly from the change in the probe beat period without comparing with reference beat. According to this method an electric circuit system has been designed, combined with an HCN laser or microwave interferometer for the measurement of line-integrated electron density of plasma in Compact Helical System (CHS). The experimental results show that this method is effective. The minimum measurable phase shift is determined by the ratio of beat frequency to the counting clock frequency, and the maximum measurable phase shift is infinite in principle. (author).

53953 (JAERI-M–89-056) **Operational limits and disruptions in tokamaks. Status and application to ITER.** Tsunematsu, Toshihide; Hogan, J.; Borrass, K.; Engelmann, F. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 51p. Order Number DE90710037. Available from NTIS (US Sales Only), PC A04/MF A01.

This report contains a concise description on status of knowledge in the area of operational limits and disruption characteristics, based on the results of workshops held during the ITER Definition Phase (1988). (author).

53954 (NIIEFA-P-NILSA–07-89) **Optimization of compact tokamak for thermonuclear burning investigation.** Katyshev, V.V.; Krivosheev, M.V. Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR). 1988. 13p. (In Russian). Order Number DE90603249. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

T-11647.

Results of optimization investigations of a tokamak with ignition obtained using the device simplified mathematical model are presented. The model includes plasma parameter computation unit and units describing main tokamak elements: electromagnetic system consisting of precooled toroidal and poloidal field windings (TFW and PFW), plasma heating and power supply systems. Minimization of tokamak cost (taking account of physical and technical limitations) was numerically calculated with respect to 12 independent variables using method of slipping allowance. The developed mathematical model can be used in preparing RFP (request for proposal) on design of experimental thermonuclear reactor. 10 refs.; 2 figs.; 1 tab.

53955 (ORNL–6551/V2) **Atomic Data for Fusion: Volume 6, Spectroscopic data for titanium, chromium, and nickel: Volume 2: Chromium.** Wiese, W.L.; Musgrove, A. (eds.). Oak Ridge National Lab., TN (USA). Sep 1989. 279p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90000969. Available from NTIS, PC A13/MF A01; OSTI; INIS; GPO Dep.

Comprehensive spectroscopic data tables are presented for all ionization stages of chromium. Tables of ionization potentials, spectral lines, energy levels, and transition probabilities are presented. These tables contain data which have been excerpted from general critical compilations prepared under the sponsorship of the National Standard Reference Data System (NSRDS).

53956 (ORNL/FTR–2480) **[MHD activity in JET]: Foreign trip report, December 6–20, 1986.** Holmes, J.A. Oak Ridge National Lab., TN (USA). 9 Jan 1987. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017410. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The first two above-stated purposes for this trip, namely those covered in the visit to the Soviet Union, are discussed in the group trip report of the entire delegation. The following contribution concerns the visit of the traveler to Culham Laboratory and JET for the purpose of understanding MHD activity in JET and other large tokamaks.

53957 (ORNL/FTR–2602) **[MHD calculations in tokamaks]: Foreign trip report, May 16–June 27, 1987.** Charlton, L.A. Oak Ridge National Lab., TN (USA). 13 Jul 1987. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017347. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Reaction to colloquia given in Lausanne and Culham is described. Information exchanged is detailed and work done at Culham is described. Perhaps the most interesting exchanges dealt with: (1) the fast sawtooth drop phenomena seen on advanced tokamak devices and (2) the physics of small-aspect-ratio tokamaks. Collaborative research was started at Culham to study infernal modes that may provide a beta limit in some devices.

53958 (ORNL/FTR–3386) **[Review of the status of atomic and molecular data for fusion edge plasma studies]: Foreign trip report, September 9, 1989–September 16, 1989.** Phaneuf, R.A. Oak Ridge National Lab., TN (USA). 2 Oct 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001244. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Representatives from both magnetic fusion plasma and atomic/molecular physics research reviewed the data requirements and the status of the atomic and molecular data base for fusion edge plasma studies. A number of significant gaps in the required data base were identified, particularly for processes involving hydrocarbon molecules. Comprehensive reviews on various sub-topics will be prepared and coordinated by the IAEA for publication in a special 1990 supplement to Nuclear Fusion. The Data Center Network assessed worldwide data compilation/evaluation activities for magnetic fusion, and the implementation of the ALADDIN data base and exchange system. This system has been widely adopted and favorably received as an effective solution to the creation, distribution, and implementation of data bases in magnetic fusion research. With input from the various data centers, the IAEA will assemble complete ALADDIN data bases and interfaces for two widely used tokamak neutral and impurity transport codes. The objective is to provide the best available atomic and molecular data for fusion applications. Under the strong leadership of R.K. Janev, the Atomic and Molecular Data Unit of the IAEA has assumed a very aggressive role in the compilation of a recommended numerical data base and in promoting its application in fusion research.

53959 (ORNL/TM–11177) **Bibliography of fusion product physics in tokamaks.** Hively, L.M.; Sigmar, D.J. Oak Ridge National Lab., TN (USA). Sep 1989. 61p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90000981. Available from NTIS, PC A04/MF A01; OSTI; INIS; GPO Dep.

Almost 700 citations have been compiled as the first step in reviewing the recent research on tokamak fusion product effects in tokamaks. The publications are listed alphabetically by the last name of the first author and by subject category.

53960 (PB–89-867550/XAB) **Nuclear fusion. January 1978-January 1982 (Citations from the NTIS data base). Report for January 1978-January 1982.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 105p. Available from NTISPC N01/MF N01.

See also PB–89-867568.

This bibliography contains citations concerning initiation of thermonuclear reactions by the control of high-temperature plasmas. Studies are included on MHD and various magnetic fusion devices. Studies sponsored solely by the Department of Energy (DOE) are excluded. (This updated bibliography contains 212 citations, none of which are new entries to the previous edition.)

53961 (PB–89-867568/XAB) **Nuclear fusion. February 1982-July 1989 (Citations from the NTIS database). Report for February 1982-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 211p. Available from NTISPC N01/MF N01.

Supersedes PB–82-804956. See also PB–89-867550.

This bibliography contains citations concerning initiation of thermonuclear reactions by the control of high-temperature plasmas. Studies are included on MHD and various magnetic fusion devices. Studies sponsored solely by the Department of Energy (DOE) are excluded. (This updated bibliography contains 428 citations, all of which are new entries to the previous edition.)

53962 (UCLA/PPG–1263) **Abstracts submitted for the thirty-first annual meeting, Division of Plasma Physics, November 13–17, 1989.** California Univ., Los Angeles, CA (USA). Inst. of Plasma and Fusion Research. Sep 1989. 41p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-86ER52134;FG03-86ER52126;FG03-86ER52130;FG03- (CONF-891106–Absts.: 31. annual meeting of the Division of Plasma Physics of the American Physical Society, Anaheim, CA (USA), 13-17 Nov 1989). Order Number DE90000948. Available from NTIS, PC A04/MF A01; OSTI; INIS.

This report contains abstracts of papers that are submitted for the 31st annual meeting of the Division of Plasma Physics, November 13–17, 1989. (LSP)

53963 X-ray plasma spectroscopy and the properties of multiply-charged ions. Proceedings of the Lebedev Physics Institute, Academy of Sciences of the USSR. Volume 179. Sobel'man, I.I. 256p. Nova Science Publishers, Inc., Commack, NY (1988).

This book provides the proceedings of the Lebedev Physics Institute Academy of Sciences of the U.S.S.R. Included are papers on laser plasma, spectroscopy, and the properties of multiply-charged ions.

53964 Experimental investigation of driven Alfven-wave resonances on the PRETEXT tokamak. Booth, W.D. Thesis (Ph. D.). 113p. Univ. of Texas, Austin, TX (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-16,401.

The results of the recent Alfven-wave experiments conducted on the PRETEXT tokamak are presented. Two quarter-turn toroidal antennas were used to drive 2.1-MHz Alfven waves in the PRETEXT plasma. Three different Global Alfven Eigenmodes were identified. The resonance frequency for each of the three observed modes was compared to the value predicted by calculation. The value of the antenna loading associated with each global resonance was measured and also compared to values predicted by a kinetic model. Additionally, the radial profile of the RF magnetic field was measured to a depth of five centimeters past the limiter in the plasma, and these magnetic fields were compared to predicted values. Generally good agreement was found between measured and predicted values. The resonance frequencies of the global modes agreed quite well and the value of the antenna loading agreed to within about 20%. The width of the measured resonances was much wider than the width of the calculated resonances. This difference is attributed principally to losses in the antenna impedance-matching system.

53965 Microstability of the sloshing ions in TMX-U. Berzins, L.V. Thesis (Ph. D.). 175p. Univ. of California, Davis, CA (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-14,289.

The microstability of the sloshing ions in the Tandem Mirror Experiment-Upgrade (TMX-U) was measured. This is the first experimental measurement of the microstability of a sloshing-ion distribution. It was found that the sloshing ions were unstable to the drift-cyclotron loss-cone instability. This instability was driven at the outer turning point of the sloshing ions. Experimental observations are compared with theoretical predictions for the drift-cyclotron loss-cone instability. It was on the basis of these comparisons that this instability was identified as the drift-cyclotron loss-cone instability. This instability affected the lifetime of the sloshing ions. The author compared the observed scaling of the sloshing-ion lifetime with the amplitude of the instability to the results of a quasi-linear theory where ion trapping is important. He shows that this instability can be stabilized by two different cold-ion populations in TMX-U. He observed warm-plasma stabilization of the instability by the cold-ion end losses. The amount of stream necessary to stabilize the instability is consistent with the theory for the drift cyclotron loss-cone instability. He also shows that warm ions trapped at the midplane can stabilize this instability, even though the instability is driven at a location removed from the midplane. This is the first experimental verification of the stabilizing effect of trapped ions for a sloshing-ion distribution.

53966 Electron behavior during electron cyclotron resonance heating in the interchangeable-module stellarator. Trost, P.K. Thesis (Ph. D.). 171p. Univ. of Wisconsin, Madison, WI (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-10,046.

Experimental and theoretical studies of the electron distribution function during electron-cyclotron-resonant heating of a target plasma in the Interchangeable Module Stellarator (IMS) were performed. Experimental results show an electron energy distribution with a bulk Maxwellian component (f_0) with a temperature of 10-25 eV, and a warm component (f_1) with an average energy of 140-160 eV. The Maxwellian part of the distribution is measured by Thomson scattering and a swept Langmuir probe. The warm component is determined by the additional transition curve that such a distribution contributes to the swept Langmuir probe I-V characteristic. The electron energy distribution is derived theoretically with the use of a particle-following Monte Carlo simulation. To model the ECH interactions with the electrons, an rf collision model, is based on stochastic electron-wave interactions, is used. Results from this code are cast into a form that allows direct comparison with experimental results. The experimentally obtained results and the calculated distributions agree well within the experimental error for densities and temperatures of the warm component over several resonant surface-interaction topologies.

53967 Experimental investigation of the dynamics of pellet ablation on the Texas Experimental Tokamak. Durst, R.D. Thesis (Ph. D.). 147p. Univ. of Texas, Austin, TX (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-16,448.

Rapid fluctuations in the ablation of hydrogen pellets in the Texas Experimental Tokamak were studied using fast photographic techniques. It is proposed that the fluctuations are a type of relaxation oscillation driven by the motion of the particle across the magnetic field. This is shown to be consistent with a time-dependent model of plasma shielding due to Kaufmann et al. A technique to include this effect in calculations of pellet ablation is discussed. Spatially resolved measurements of the temperature and density in the pellet-ablation cloud were obtained by line-to-continuum ratios and Stark broadening, respectively. Typical parameters in the pellet-ablation cloud are 5-6 eV and 1.0-1.5 x 10^{17} cm^{-3}. The flow along

the magnetic field is found to be isobaric. The heating of the expanding ablatant is strongly asymmetric, being stronger on the side facing the electron-drift direction. This may be due to suprathermal electrons.

53968 Time-of-flight potential diagnostics for tandem mirrors. Archer, B.T. III. Thesis (Ph. D.). 154p. Univ. of California, Berkeley, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-13,779.

Two time-of-flight potential diagnostics for tandem mirrors are investigated. These diagnostics are designed to measure axial potential variations in tandem-mirror plasma geometries. One approach investigated employs an electron beam as a potential probe, and the other employs a helium ion beam. In each case, a modulated beam is injected along the magnetic axis of the magnetic field into the plasma confinement region. The velocity of the beam particles varies as the beam moves through variations in the electrostatic potential. Since the beam is modulated, variations in beam velocity modify the modulation phase of the beam along the beam trajectory. In the case of the electron beam, the phase of the beam is remotely detected by using a Rogowski loop that encircles the plasma. The phase of the helium ion beam can be measured by observing the light emitted by the helium ions. A theoretical study was made regarding the feasibility of the modulated ion beam concept for measuring potentials in the TMX-U and MFTF-B tandem mirrors machines at the Lawrence Livermore National Laboratory. The estimated potential uncertainties for these machines appear quite small, provided an ion beam of the required quality can be modulated at a high enough frequency. In order to address this concern, a 5-k-V, 10-mA ion beam was designed, fabricated, and tested.

53969 Tokamak fusion-reactor design using recent theoretical models of heat transport. Ibrahim, E. Thesis (Ph. D.). 115p. Univ. of California, Berkeley, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-13,922.

A survey of several theoretical models of heat transport is presented, culminating in the development of a one-fluid and a two-fluid transport model. The one-fluid model is based on the assumption that the ion and electron thermal diffusivity is equal to the thermal diffusivity due to η_i modes. The two fluid model is based on the assumption that the electron thermal transport is due to trapped-electron mode instability and the ion thermal transport is due to neoclassical diffusion, in the banana regime, and additionally due to η_i modes when $\eta_i < \eta_{ic} = 1.5$. The two-fluid model predicts a τ_E scaling that is in reasonable agreement with the empirical τ_E scaling for auxiliary heated tokamaks known as Kaye-Goldston Scaling. The two-fluid model's τ_E scaling is used to design the smallest-size tokamak fusion reactor that can achieve ignition. The design parameters of this reactor are given.

53970 Effect of wave localization on plasma instabilities. Levedahl, W.K. Thesis (Ph. D.). 131p. Univ. of California, Berkeley, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-13,958.

The Anderson model of wave localization in random media is invoked to study the effect of solar-wind density turbulence on plasma processes associated with the solar type-III radio burst. ISEE-3 satellite data indicate that a possible model for the type-III process is the parametric decay of Langmuir waves excited by solar-flare electron streams into daughter electromagnetic and ion-acoustic waves. The threshold for this instability, however, is much higher than observed Langmuir-wave levels because of rapid wave convection of the transverse electromagnetic daughter wave in the case where the solar wind is assumed homogeneous. Langmuir and transverse waves near critical density satisfy the Ioffe-Riegel criteria for wave localization in the solar wind with observed density fluctuations ~1%. Computer simulations using a linearized hybrid code show that an electron beam will excite localized Langmuir waves in a plasma with density turbulence. An action-principle approach is used to develop a theory of nonlinear wave processes when waves are localized. A theory of resonant particles diffusion by localized waves is developed to explain the saturation of the beam-plasma instability.

53971 Computer simulation of bounded plasmas. Lawson, W.S. Thesis (Ph. D.). 165p. Univ. of California, Berkeley, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-13,952.

The problems of simulating a one-dimensional bounded plasma system using particles in a gridded space are systematically explored and solutions to them are given. Such problems include the injection of particles at the boundaries, the solution of Poisson's equation, and the inclusion of an external circuit between the confining boundaries. A recently discovered artificial cooling effect is explained as being a side-effect of quiet injection, and its potential for causing serious but subtle errors in bounded simulation is noted. The methods described in the first part of the thesis are then applied to the simulation of an extension of the Pierce diode problem, specifically a Pierce diode modified by an external circuit between the electrodes. The results of these simulations agree to high accuracy with theory when a theory exists, and also show some interesting chaotic behavior in certain parameter regimes. The chaotic behavior is described in detail.

53972 Parametric study of axisymmetric fusion devices. Ducar, W.S. Thesis (Ph. D.). 186p. Univ. of California, Davis, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-09,749.

Three different axisymmetric magnetic mirror fusion machines are examined in order to optimize the ratio the fusion power produced by them to the power injected into them to maintain the plasma. These three devices were chosen to study the continuum between a simple mirror and a tandem mirror. This allowed the evolutionary process leading from the simple to the tandem mirror to be examined in detail. The Kelley mirror, which corresponds to the middle step, was examined in depth for the first time. A computer code that models the plasma in these machines was written to investigate the steady-state operation of these machines. The balance equations are solved by using an ordinary differential equation solver, LSODE, to numerically solve the system of differential equations. The computer model was used to examine parameter space to optimize Q for each of the three machines. When feasible, a comparison with a Fokker-Planck code was made for the optimal Q case for each machine. Finally, the possible roles these devices might fill was discussed.

53973 Some aspects of plasma kinetic theory: Energetic particle physics; renormalization theory; anomalous electron transport in tokamaks. Zhang, Yangzhong. Thesis (Ph. D.). 262p. Univ. of Texas, Austin, TX (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-16,625.

This dissertation discusses three special topics of collisionless plasma kinetic theory and their applications pertinent to high-temperature magnetic-confinement experiments oriented to nuclear fusion research. The first topic is energetic-particle physics. Appropriate equations are derived from first principles and applied to mirror configurations. A significant contribution is the prediction of a diamagnetic limit due to negative-energy precessional waves. Discussion is given on whether experiments exist that violate this stability limit. The major theme of the second topic is construction of rigorous formal systematology for nonlinear Vlasov equations with electromagnetic interactions in order to produce a renormalized perturbation theory to arbitrary higher order. The last topic is the theoretical study of anomalous electron energy transport in a tokamak. In combination with phenomenological analysis, a formula for local electron energy transport coefficient is proposed on the theoretical basis for strong microturbulence on the scale of the electromagnetic skin depth.

53974 Patches of electrons and electron sheets for the 1-D Vlasov-Poisson equation. Dziurzynski, R.S. Thesis (Ph. D.). 215p. Univ. of California, Berkeley, CA (US) (1987). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-13,858.

The author studies two classes of weak solutions for the 1-D Vlasov-Poisson equation describing plasma flows - patches of electrons and electron sheets. These solutions are analogous to patches of vorticity and vortex sheets for the 2-D vorticity equation. First, the existence of a given electron density is proved. It is shown that the corresponding flow map is Lipschitz continuous globally in

time - so any initially smooth curve evolving with the flow remains rectifiable. Then the contour dynamics equation is derived for evolution of the boundaries z (α, t) of electron layers. The existence and uniqueness of smooth z(α, t) is proved up to the time t_* of folding formation. The author designs a numerical method, proves its second-order convergence, and computes several numerical solutions. Finally, he derives equations for evolution of regularized and limit electron sheets. He designs numerical methods, proves their second-order convergence, and computes several numerical solutions. He derives a large class of exact solutions z (α, t).

53975 Magnetic- and material-limiter discharges in Tokapole II. Moyer, R.A. Thesis (Ph. D.). 340p. Univ. of Wisconsin, Madison, WI (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-10,477.

Disruptive instabilities were studied in Tokapole II, a small poloidal-divertor tokamak, in magnetic- and material-limiter configurations. In the magnetic limiter configuration, the divertor separatrix defines the tokamak current channel boundary. Limiters or neutralizer plate are not used to remove plasma in the scrape-off region. The relatively hot, dense plasma in the scrape-off region carries 5-20% of the current. In the material-limiter configuration, limiter plates are inserted to the separatrix to remove plasma and current in the scrape-off region. The plates vary the tokamak current-channel boundary condition in a controlled manner, and provide a benchmark for comparison with other tokamaks. Internal and external disruptions have been studied, and several unique features in the magnetic-limiter configuration were identified. The magnetic-limiter configuration enables routine passing of the stability barriers at q(a) = 2 and q(a) = 1, where q(a) is the edge safety factor, without a close-fitting wall, external windings, or detailed profile control techniques. Passing the q(a) = 1 barrier permits operation in the $q < 1$ regime where total reconnection of the sawtooth does not occur.

53976 Self-consistent bounce-averaged transport computations for stellarators. D'haeseleer, W.D. Thesis (Ph. D.). 463p. Univ. of Wisconsin, Madison, WI (US) (1988). Available from University Microfilms, PO Box 1764, Ann Arbor, MI 48106, Order No.88-10,012.

A numerical code FLOCS (Flow Code for Stellarators), which computes the self-consistent radial particle fluxes and the bootstrap current in stellarators, was developed. The code finds the distribution function $\bar{f}$, as a function of three variables, one spatial, Θ, and two in velocity space, E and y where y is the ripple-depth parameter. $\bar{f}$ is computed on a fixed-flux surface, and bounce averaging over the helical ripples effectively eliminates the toroidal angle from the problem. The energy-integrated particle fluxes are computed, and the balance point where ion and electron fluxes are equal determines the ambipolar electric field. To perform the integrations over pitch angle to find the parallel flows, a multi-mesh method in y is employed. The impact of momentum-restoring terms in the collision operator, C is evaluated. Theoretically, their presence is required to replace the parallel momentum that is lost by the Lorentz part of C. Results are presented for a stellarator-reactor plasma extrapolated from ATF parameters.

53977 Review of impact fusion concepts. Ribe, F.L. (Washington Univ., Seattle, WA (USA). Dept. of Nuclear Engineering); Barnes, D.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 20-26 (Jan 1989).

The authors review the main features of the impact fusion concept in which gram-sized metallic projectiles from electromagnetic launchers collide around heavy-hydrogen fusile gas to produce thermonuclear plasma whose pressure brings the projectiles to rest, providing a pulse of fusion power during the "turnaround" of the projectiles. A quasispherical implosion of the projectile metal about the gas cavity is necessary to achieve sufficient fusion energy gain. Hydrodynamic calculations show that initial projectile rectilinear motion can be converted to such an implosion. The required projectile velocity can be greatly reduced by means of magnetic insulation of the plasma. Here closed-line magnetic fields reduce the thermal conduction to the metallic cavity wall, allowing a longer heat-diffusion time to replace the inertial stagnation time of the projectiles against the fusion plasma. The linked poloidal and toroidal fields of the final magnetic configuration constitute magnetic helicity H which is approximately conserved during the entire impact. This allows magnetic fields in the initial "struck" configuration with convenient open magnetic geometry to be suitably linked during the plasma compression to produce the final closed magnetic configuration. Even when the initial open fields have no helicity, such helicity can be produced during the impact by mechanical injection of helicity from the moving contact circle of the projectiles at their interface.

53978 Periodic traveling waves bifurcating from multi-humped vlasov equilibria. Holloway, J.P.; Dorning, J.J. *Transactions of the American Nuclear Society (USA),* 56: 311-313 (1988). (CONF-880601--: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

This analysis provides solutions to the full nonlinear plasma oscillation problem near Vlasov equilibria, the linearized version of which was first studied by Vlasov, Landau, Van Kampen, and Case.

53979 Characteristic finite element method for the vlasov-poisson system. Victory, H.D. Jr.; Ganguly, K. *Transactions of the American Nuclear Society (USA),* 56: 313-314 (1988). (CONF-880601--: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

In particle simulation of plasmas, the initial positions and velocities of the particles are chosen according to the initial distribution function either randomly or in an ordered manner. The authors present the algorithm for the multidimensional Vlasov-Poisson system. The electrostatic energy calculated by the present method compares well with the particle simulation results up to a time of 10 plasma periods. Beyond this, the algorithm does not perform well due to the fine structure of f(t,x,v) as time increases. A suitable refinement of the present algorithm awaits further work.

53980 Response times and energy partitioning in electron-beam-excited plasmas. Kushner, M.J. (University of Illinois, Department of Electrical and Computer Engineering, Gaseous Electronics Laboratory, 607 East Healey, Champaign, Illinois 61820 (US)). *Journal of Applied Physics (USA),* 66(6): 2297-2306 (15 Sep 1989).

Excimer lasers are typically excited by electron beams (*e* beams) with initial energies of 100's of keV to a few MeV. The *e*-beam response time is the interval required for beam electrons and their energetic secondary electrons to slow below the first inelastic thresholds of the buffer gas, below which the electrons thermalize by elastic momentum transfer collisions. In this paper, *e*-beam response times for rare gases and for gas mixtures typically used for excimer lasers are discussed using results from a Monte Carlo simulation. Issues pertaining to energy partitioning (*W* values in mixtures and effective electron temperatures) are also discussed. We find that *e*-beam response times may be >10's of ns in gas mixtures of a few atm. As these times are commensurate with the rise time of *e*-beam pulses or the width of shorter pulses, beam slowing effects must be considered when modeling these phases of *e*-beam pumping.

53981 Current channel migration and magnetic field penetration in a perfectly conducting plasma with emitting, conducting boundaries. Grossmann, J.M. (Plasma Physics Division, Naval Research Laboratory, Washington, DC 20375-5000 (US)); Ottinger, P.F.; Mason, R.J. *Journal of Applied Physics (USA),* 66(6): 2307-2314 (15 Sep 1989).

In collisionless simulations of the plasma erosion opening switch, a highly conductive plasma allows magnetic field penetration through the entire length of the plasma, to depths almost two orders of magnitude greater than the collisionless skin depth, c/ω_{pe}. Field penetration is accomplished by a narrow (skin-depth-like) current channel that migrates through the plasma. The plasma behind the current channel is unable to shield the rising magnetic field from the body of the plasma and allows it to penetrate almost instantly and completely through the plasma up to the current channel. The migration of the channel and the penetration of the field appear to occur in the absence of both Coulomb collisions and instabilities. These unusual features are permitted by the electric field structure in the plasma behind the current channel and the presence of conducting boundaries that can emit electrons.

53982 An elliptical spectrograph/fiber-array/streak camera system for remote time-resolved spectral measurements in the

x-ray region. Hammel, B.A. (Sandia National Laboratories, Albuquerque, New Mexico (US)); Ruggles, L.E. *Review of Scientific Instruments (USA),* 60(9): 2861-2867 (Sep 1989). DOE Contract AC04-76DP00789.

An elliptical spectrograph and a scintillator/fiber-array detection system have been developed to provide time-resolved measurements of the x-ray spectra from a *Z*-pinch plasma. The elliptical spectrograph (1.2-m focal distance, eccentricity=0.9586) observes the 1-keV region, covering a range of $\lambda/2d$=0.5–0.9. The detector consists of a thin scintillator butt-coupled to a fiber optic array which transmits the signal to a streak camera in a remote location. This system provides continuous time history with temporal resolution of ~3 ns, and a spectral resolving power of ~165. The detection scheme is limited to spectral lines with intensities greater than $\sim 10^6$ W/sr-eV.

53983 A method to measure magnetic field perturbations in plasma devices. Jackson, G.L. (General Atomics, P.O. Box 85608, San Diego, California 92138 (US)); DeGrassie, J.S.; Schaffer, M.J.; Taylor, T.S.; Gentle, K.W. *Review of Scientific Instruments (USA),* 60(9): 2883-2887 (Sep 1989).

Magnetic field perturbations with specific spatial geometry can be detected in the presence of a large magnetic field "background" using printed circuit pickup coils which have the advantages of large effective area, near dc frequency response, precise geometry, thin profile, and low cost. The design and construction techniques to produce these coils are presented. A printed circuit coil has been used to detect the magnetic field from the perturbed plasma current distribution in the TEXT tokamak due to current in an external helical (m=7,n=3) winding. The measured sensitivity of this coil, $\Delta B_{coil}/B_{total}$, is $\sim 3 \times 10^{-6}$.

53984 Two-dimensional plasma-electron temperature measurements. Goodman, D.L. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139 (US)). *Review of Scientific Instruments (USA),* 60(9): 2835-2837 (Sep 1989).

A system to measure the two-dimensional cold-electron temperature profile in a magnetic confinement laboratory plasma is described. Using a digital storage CCD camera, image intensifier, and optical transmission filters, a two-dimensional helium-line emission-ratio measurement shows plasma features which are not possible to resolve using only a single detector or an array of detectors. The system is especially useful for nonaxisymmetric magnetic geometries, where the three-dimensional equilibria make interpretation of more standard measurements difficult. Other two-dimensional plasma-profile measurements including density and ionization source measurements are also possible using the system.

53985 (ANL/FPP/TM–240) **KAOS-V code: An evaluation tool for neutron kerma factors and other nuclear responses.** Farawila, Y.; Gohar, Y.; Maynard, C. Argonne National Lab., IL (USA). Sep 1989. 122p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90000989. Available from NTIS, PC A06/MF A01; OSTI; INIS; GPO Dep.

The accurate evaluation of neutron fluence-to-kerma factors from microscopic nuclear data is the subject of this report. The algorithms developed for this purpose combine in a consistent manner the two basic methods for computing kerma factors, namely kinematics and direct energy balance. These algorithms are implemented in the code KAOS-V which was used as the main evaluation tool to construct the response function library KAOS/LIB-V. KAOS-V uses data from the evaluated nuclear data files ENDF/B/V. Auxiliary nuclear data bases, e.g., the Japanese evaluated nuclear data library JENDL-2 can be used as a source of isotopic cross sections when these data are not provided in ENDF/B-V files for a natural element. These are needed mainly to estimate average quantities such as effective Q-values for the natural element. The code has the ability to compare the different results which aids in the choice of a consistent set of algorithms to evaluate kerma factors. Data in ENDF/B-IV and ENDF/B-V format can be processed. For resonance treatment, the code has the ability to access NJOY and NPTXS interface files in formatted or binary forms. No input instructions are necessary to run the code interactively. The user can simply respond to the interactive messages sent by the code if an INPUT file is absent. An INPUT file is automatically generated following an interactive run, and can be edited and used to rerun or produce different results. Grouped and point output data can be produced along with graphic representation. These features are instrumental in detecting and understanding energy balance deficiencies and other problems in the nuclear data files. 60 refs., 4 figs.

53986 (CNIC–00209) **Fusion-fission fuel factory conceptual design for China.** Qiu Lijian. China Nuclear Information Centre, Beijing, BJ (China). Apr 1988. 15p. (In Chinese). Order Number DE90603380. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The necessity and technical feasibility of a Fusion-Fission Fuel Factory for supporting PWR nuclear power station in China has been investigated both through parametic system studies and some key fusion nuclear technology experiments. The main aim is to study the reality for fuelling an experimental fusion-fission hybrid reactor at the beginning of the next centry in Chian. The study demonstrates that the fusion-fission hybrid reactor has the potential to cover a wider range of reasonable sizes and existing technology than that has been considered perviously.

53987 (CONF-891007–17) **Characteristics of an electron-beam rocket pellet accelerator.** Tsai, C.C.; Foster, C.A.; Schechter, D.E. Oak Ridge National Lab., TN (USA). [1989]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001595. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

An electron-beam rocket pellet accelerator has been designed, built, assembled, and tested as a proof-of-principle (POP) apparatus. The main goal of accelerators based on this concept is to use intense electron-beam heating and ablation of a hydrogen propellant stick to accelerate deuterium and/or tritium pellets to ultrahigh speeds (10 to 20 km/s) for plasma fueling of next-generation fusion devices such as the International Thermonuclear Engineering Reactor (ITER). The POP apparatus is described and initial results of pellet acceleration experiments are presented. Conceptual ultrahigh-speed pellet accelerators are discussed. 14 refs., 8 figs.

53988 (CONF-891007–19) **Tritium proof-of-principle pellet injector results.** Fisher, P.W.; Fehling, D.T.; Gouge, M.J.; Milora, S.L. Oak Ridge National Lab., TN (USA). 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001653. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The tritium proof-of-principle (TPOP) experiment was built by Oak Ridge National Laboratory (ORNL) to demonstrate the feasibility of forming solid tritium pellets and accelerating them to high velocities for fueling future fusion reactors. TPOP used a pneumatic pipe-gun with a 4-mm-i.d. by 1-m-long barrel. Nearly 1500 pellets were fired by the gun during the course of the experiment; about a third of these were tritium or mixtures of deuterium and tritium. The system also contained a cryogenic ^{3}He separator that reduced the ^{3}He level to <0.005%. Pure tritium pellets were accelerated to 1400 m/s. Experiments evaluated the effect of cryostat temperature and fill pressure on pellet size, the production of pellets from mixtures of tritium and deuterium, and the effect of aging on pellet integrity. The tritium phase of these experiments was performed at the Tritium Systems Test Assembly (TSTA) at Los Alamos National Laboratory. About 100 kCi of tritium was processed through the apparatus without incident. 8 refs., 7 figs.

53989 (CONF-891007–20) **Remote maintenance of Compact Ignition Tokamak ex-vessel systems.** DePew, R.E.; Macdonald, D. Oak Ridge National Lab., TN (USA). 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001637. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The use of deuterium-tritium (D-T) fuel in the Compact Ignition Tokamak (CIT) will require applying remote handling technology for ex-vessel maintenance and replacement of machine components. Highly activated and contaminated components of the fusion device's auxiliary systems, such as diagnostics and RF heating, must be replaced using remotely operated maintenance equipment in the test cell. Throughout the CIT remote maintenance (RM) studies conducted to date, computer modeling has been used extensively to investigate manipulator access in these complex, tightly packed, and cluttered surroundings. A recent refinement of computer modeling involves the use of an intelligent engineering work station for realtime interactive display of task simulations. This paper discusses the use of three-dimensional (3-D) kinematic computer models of the CIT machines that are proving to be powerful tools in our efforts to evaluate RM requirements. This presentation includes a videotaped simulation of remote replacement of a plasma viewing assembly. The simulation illustrates some of the constraints associated with typical RM activities and the ways in which computer modeling enhances the design process. 1 ref., 3 figs.

53990 (CONF-891007–21) **The control system for the multiple-pellet injector on the Joint European Torus.** Baylor, L.R.; Jernigan, T.C.; Stewart, K.A. Oak Ridge National Lab., TN (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001626. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A stand-alone control and data acquisition system for the Oak Ridge National Laboratory (ORNL) multiple-pellet injector installed on the Joint European Torus (JET) has been designed and installed with the injector. This system, which is based on a MicroVAX II computer and a programmable logic controller (PLC), is an upgrade of previous systems designed for ORNL pellet injectors installed on other fusion experiments. The primary control system upgrades are in the user interface, in the automation of sequential injector operation, and in the analysis of the transient data acquired for each pellet fired. The system is integrated into the JET CODAS environment through CAMAC communications modules with customized communications software. Routine operation of the injector is automated and requires no operator intervention. Details of the hardware and software design and the operation of the system are presented in this paper. 4 refs., 3 figs.

53991 (CONF-891007–25) **Particle exhaust schemes in the DIII-D advanced divertor configuration.** Menon, M.M.; Mioduszewski, P.K. Oak Ridge National Lab., TN (USA). 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001738. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

For density control in long-pulse operation, the open divertor on the DIII-D tokamak will be equipped with a baffled chamber and a pumping system. The throat of the baffle chamber is sized to provide optimal pumping for the typical plasma equilibrium configuration. Severe limitations on the toroidal conductance of this baffle chamber require the use of in-vessel pumping to achieve the desired particle exhaust of about 25 Torr·l/s. Two separate pumping schemes are considered: an array of titanium getter modules based on the design developed by the Tore Supra team and a cryocondensation pump. The merits and demerits of each scheme are analyzed, and the design considerations introduced by the tokamak environment are brought out. 3 refs., 5 figs.

53992 (CONF-891007–26) **Insulation interlaminar shear strength testing with compression and irradiation.** McManamy, T.J.; Brasier, J.E.; Snook, P. Oak Ridge National Lab., TN (USA). [1989]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001740. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The Compact Ignition Tokamak (CIT) project identified the need for research and development for the insulation to be used in the toroidal field coils. The requirements included tolerance to a combination of high compression and shear and a high radiation dose. Samples of laminate-type sheet material were obtained from commercial vendors. The materials included various combinations of epoxy, polyimide, E-glass, S-glass, and T-glass. The T-glass was in the form of a three-dimensional weave. The first tests were with 50 × 25 × 1 mm samples. These materials were loaded in compression and then to failure in shear. At 345-MPa compression, the interlaminar shear strength was generally in the range of 110 to 140 MPa for the different materials. A smaller sample configuration was developed for irradiation testing. The data before irradiation were similar to those for the larger samples but approximately 10% lower. Limited fatigue testing was also performed by cycling the shear load. No reduction in shear strength was found after 50,000 cycles at 90% of the failure stress. Because of space limitations, only three materials were chosen for irradiation: two polyimide systems and one epoxy system. All used boron-free glass. The small shear/compression samples and some flexure specimens were irradiated to 4×10^9 and 2×10^{10} rad in the Advanced Technology Reactor at Idaho National Engineering Laboratory. A lead shield was used to ensure that the majority of the dose was from neutrons. The shear strength with compression before and after irradiation at the lower dose was determined. Flexure strength and the results from irradiation at the higher dose level will be available in the near future. 7 refs., 7 figs., 2 tabs.

53993 (CONF-891007–27) **ITER [International Thermonuclear Experimental Reactor] reactor building design study.** Thomson, S.L.; Blevins, J.D.; Delisle, M.W. Oak Ridge National Lab., TN (USA). [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001728. Available from NTIS, PC A03/MF A01; OSTI; INIS.

The International Thermonuclear Experimental Reactor (ITER) is at the midpoint of a two-year conceptual design. The ITER reactor building is a reinforced concrete structure that houses the tokamak and associated equipment and systems and forms a barrier between the tokamak and the external environment. It provides radiation shielding and controls the release of radioactive materials to the environment during both routine operations and accidents. The building protects the tokamak from external events, such as earthquakes or aircraft strikes. The reactor building requirements have been developed from the component designs and the preliminary safety analysis. The equipment requirements, tritium confinement, and biological shielding have been studied. The building design in progress requires continuous iteraction with the component and system designs and with the safety analysis. 8 figs.

53994 (CONF-891007–28) **The ORNL fast wave ICRF [Ion Cyclotron Range of Frequencies] antenna for Alcator C-Mod.** Goulding, R.H.; Hoffman, D.J.; Conner, D.L.; Hammonds, C.J.; Ping, J.L.; Riemer, B.W.; Ryan, P.M.; Taylor, D.J.; Wysor, R.B.; Yugo, J.J. Oak Ridge National Lab., TN (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001969. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A fast wave ICRF antenna is being designed for Alcator C-Mod which is prototypical in many respects of the baseline launcher design for the Compact Ignition Tokamak (CIT). The C-Mod launcher has a single current strap, with a strap and cavity geometry very similar to one quadrant of the CIT launcher, which has four straps in a 2 × 2 configuration. The antenna fits entirely within an 8 in. wide by 25 in. long port and is radially movable over a distance of 15 cm. It will operate at a frequency of 80 MHz for pulse lengths up to 1 s, at a maximum power level of 2 MW, corresponding to a power flux of >1.5 kW/cm^2. The antenna is an end fed double loop configuration in which the current strap is grounded in the middle to provide mechanical support. The design includes a disruption support system which accommodates thermal expansion of the antenna box while supporting large disruption loads. It also includes a novel matching system consisting of an external resonant loop with two shunt capacitors serving as tuning/matching elements. 8 refs., 5 figs., 12 tabs.

53995 (CONF-891007–29) **Design and development of a fast-response ionization gauge controller.** Halliwell, J.W.; Dyer, G.R.; Simpkins, J.E. Oak Ridge National Lab., TN (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001970. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Fast pressure measurements in the divertor and pump limiter chambers used in magnetic confinement fusion experiments require a system that can respond to a broad range of pressures while maintaining good noise immunity. Available designs of gauge controllers were unable to provide a acceptable noise immunity. A fast ionization gauge controller that can respond to pressure changes in the range from 1×10^{-1} to 2×10^{-5} Torr in less than 10 ms using a Schultz-Phelps gauge assembly has been developed. The Schultz-Phelps gauge provides full coverage of the desired pressure range and is less susceptible to magnetic field interference than other available types of ionization gauges. The gauge controller as designed provides simultaneous readout of three decades of pressure. Major design concerns have been to minimize noise induced by the gauge tube filament drive and noise pickup by the ionization current electrometer. By using DC filament drive, a major shortcoming of available gauge controllers, i.e., 60-Hz pickup caused by filament modulation of the electron current, has been overcome. Second, by locating the electrometer amplifier as close to the Schultz-Phelps gauge as possible, cable-induced noise pickup has been reduced to an acceptable level. Problems encountered in the design and test of the gauge controller and future improvements are discussed. 3 refs., 4 figs.

53996 (CONF-891007–30) **Technology of fast-wave current drive antennas.** Hoffman, D.J.; Baity, F.W.; Goulding, R.H.; Haste, G.R.; Ryan, P.M.; Taylor, D.J.; Swain, D.W.; Mayberry, M.J.; Yugo, J.J. Oak Ridge National Lab., TN (USA). 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001972. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The design of fast-wave current drive (FWCD) antennas combines the usual antenna considerations (e.g., the plasma/antenna interface, disruptions, high currents and voltages, and thermal loads) with new requirements for spectral shaping and phase control. The internal configuration of the antenna array has a profound effect on the spectrum and the ability to control phasing. This paper elaborates on these considerations, as epitomized by a proof-of-principle (POP) experiment designed for the DIII-D tokamak. The extension of FWCD for machines such as the International Thermonuclear Engineering Reactor (ITER) will require combining ideas implemented in the POP experiment with reactor-relevant antenna concepts, such as the folded waveguide. 6 refs., 8 figs.

53997 (CONF-891007–32) **Remote maintenance for fusion: Requirements vs technology gap.** Davis, F.C.; Kuban, D.P. Oak Ridge National Lab., TN (USA). [1989]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001962. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Today's remote handling technology was developed in response to the remote maintenance (RM) requirements of the fission community's nuclear fuel recycle process. The needs of the fusion community present new challenges to the remote handling experts of the world. New difficulties are superimposed on the difficulties experienced in maintaining fission processes. Today's technology must be enhanced to respond to the RM needs of these future huge investments. This paper first discusses the current RM needs for fusion based on existing facilities and designs of future machines. It then exposes the gap between these requirements and existing RM technology and recommends ways to extend the state of the art to close this gap.

53998 (CONF-891007–33) **Operation and reliability of a pneumatic hydrogen pellet injection system on the Joint European Torus.** Combs, S.K.; Jernigan, T.C.; Baylor, L.R.; Milora, S.L.; Foust, C.R.; Kupschus, P.; Gadeberg, M.; Bailey, W. Oak Ridge National Lab., TN (USA). [1989]. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001961. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A pneumatic-based, hydrogen isotope pellet injector that was developed at the Oak Ridge National Laboratory for the plasma fueling application on the Joint European Torus (JET) was described at the last Symposium on Fusion Engineering (1987). The injector was installed on JET during 1987 and has since been used in plasma fueling experiments. The injector consists of three independent machine-gun-like mechanisms (nominal pellet sizes of 2.7, 4.0, and 6.0 mm in diameter), and it features repetitive operation (1-5 Hz) for quasi-steady-state conditions (>10 s). An extensive set of injector diagnostics permits evaluation of parameters for each pellet shot, including speed, mass, and integrity. Pellet speeds can be varied but typically range from 1.0 to 1.5 km/s. Over 5000 pellets have been fired with the equipment at JET, including about 2000 pellets shot for plasma fueling experiments. In recent experiments, the system performance has been outstanding, including excellent reproducibility in pellet speed and mass and a reliability of >98% in delivery of pellets to the plasma. 7 refs., 5 figs.

53999 (CONF-891007–34) **Scenarios for ITER [International Thermonuclear Experimental Reactor] steady-state and technology testing operation.** Galambos, J.; Peng, Y-K.M.; Perkins, L.J. Oak Ridge National Lab., TN (USA). [1989]. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international symposium on fusion engineering; Knoxville, TN (USA); 2-6 Oct 1989. Order Number DE90001966. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Operational scenarios for the International Thermonuclear Experimental Reactor (ITER) steady-state and technology testing phases are identified by trade-offs among wall load, burn time, and divertor heat loads. Steady-state operation with $Q \geq 5$ is limited to wall loads ≥ 0.5 MW/m^2 and injection powers ≥ 100 MW. Even at steady-state wall loads of 0.5 MW/m^2, the divertor heat loads are higher than predicted for the physics phase. For technology testing, hybrid operation (with simultaneous inductive and noninductive current drive) results in a wall load of 0.8 MW/m^2, with injection power of about 100 MW, and a burn time of about 1200 s, with a divertor heat load similar to that of the physics phase. Significant uncertainty exists in our present understanding of the divertor conditions. Should conditions prove to be more favorable than assumed here, the operational windows would open considerably. For factor of $\approx$3 reductions in predicted divertor loads, we show potential steady-state cases at wall loads of 0.8 MW/m^2, injection powers of about 130 MW, and Q near 7. With factors of $\approx$1.5–2.5 reduction in the predicted divertor loads, hybrid technology testing could be accomplished with wall loads of 0.8 MW/m^2 burn times of 1–3 h, and injection powers of 100–150 MW. 5 refs., 3 figs., 2 tabs.

54000 (CONF-891093–3) **Potential applications of an electron cyclotron resonance multicusp plasma source.** Tsai, C.C.; Berry, L.A.; Gorbatkin, S.M.; Haselton, H.H.; Roberto, J.B.; Stirling, W.L. Oak Ridge National Lab., TN (USA). [1989]. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 36. American Vacuum Society national vacuum symposium; Boston, MA (USA); 23-27 Oct 1989. Order Number DE90001358. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An electron cyclotron resonance (ECR) multicusp plasmatron has been developed by feeding a multicusp bucket arc chamber with a compact ECR plasma source. This novel source produced large (about 25-cm-diam), uniform (to within $\pm$10%), dense (>10^{11}-cm^{-3}) plasmas of argon, helium, hydrogen, and oxygen. It has been operated to produce an oxygen plasma for etching 12.7-cm (5-in.) positive photoresist-coated silicon wafers with uniformity within $\pm$8%. Results and potential applications of this new ECR plasma source for plasma processing of thin films are discussed. 21 refs., 10 figs.

54001 (CONF-8909210–3) **Independent-particle model for fusion in cluster impact.** Crawford, O.H. Oak Ridge National Lab., TN (USA). [1989]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 12. Werner Brandt international workshop on charged particle penetration phenomena; San

Sebastian (Spain); 4-7 Sep 1989. Order Number DE90001338. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Theory is presented in an independent-particle model for the fusion yields from impact of accelerated $(D_2O)_n^+$ clusters on TiD. It is assumed that deuterons from an incident cluster penetrate the medium independently of each other. Comparison is made with the recent experiment of Beuhler, Friedlander, and Friedman. The measured yields (fusion events per incident cluster) are many orders of magnitude higher than the calculated ones (based on this theory). This shows that cooperative effects, involving the cluster, are crucial to interpretation of the reported results. The calculations illustrate the necessity of rigorously excluding low-mass deuterium-containing ions from the incident beam in such an experiment. 7 refs., 1 fig.

54002 (DOE/ER–0313/6) **Fusion reactor materials: Semiannual progress report for the period ending March 31, 1989.** Oak Ridge National Lab., TN (USA). 1989. 423p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. (ORNL/M–919). Order Number DE90000976. Available from NTIS, PC A17/MF A01; OSTI; INIS; GPO Dep.

This paper discuses the following topics on fusion reactor materials: irradiation, facilities, test matrices, and experimental methods; dosimetry, damage parameters, and activation calculations; materials engineering and design requirements; fundamental mechanical behavior; radiation effects; development of structural alloys; solid breeding materials; and ceramics.

54003 (DOE/ER/53222–100) **[High beta tokamak research]: Progress report, November 8, 1987–July 1, 1989.** Columbia Univ., New York, NY (USA). Plasma Physics Lab. [1989]. 45p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER53222. Order Number DE90002135. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Our activities on High Beta Tokamak Research during the past 20 months of the present grant period can be divided into six areas: reconstruction and modeling of high beta equilibria in HBT; measurement and analysis of MHD instabilities observed in HBT; measurements of impurity transport; diagnostic development on HBT; numerical parameterization of the second stability regime; and conceptual design and assembly of HBT-EP. Each of these is described in some detail in the sections of this progress report.

54004 (ETDE-IT–89-01) **Liquid nitrogen cooling system for FTU Tokamak machine.** Migliori, S.; Bettinali, L.; Gasparotto, M.; Pizzuto, A. ENEA, Frascati (Italy). Centro Ricerche Energia. Jul 1988. 5p. (CONF-880736–7: 12. international cryogenic engineering conference and exhibition, Southampton (UK), 12-15 Jul 1988). Order Number DE89793195. Available from NTIS (US Sales Only), PC A02/MF A01.

This report lists the main parameters of the FTU machine and describes the function of its cryogenic system and the system's principal components - valves, phase separator, pumps and control system. The basic idea in the design of the FTU (Frascati Tokamak Upgrade) machine is to try to reach a range of plasma parameters of great thermonuclear interest within a reasonable financial effort. In the FTU, the good energy confinement properties of a compact tokamak with a medium high toroidal field: 8 T, are combined with the strong plasma heating obtained by injecting up to 8 MW of radiofrequency power in the lower hybrid "electron mode" (8 GHz). The basic mechanical structure of the machine is provided by the monolithic toroidal magnet supporting the vacuum chamber and the poloidal field windings. The machine is kept, during operation, at liquid nitrogen temperature (-196 degrees centigrade), to minimize the power consumption in the magnet coils and the poloidal field windings and to take advantage of the higher mechanical properties of the structural materials (stainless steel and copper) at cryogenic temperature. Liquid nitrogen was selected as the coolant because of its high latent heat of vaporization, its relatively low cost and ease of handling. The liquid nitrogen plant was ordered from the firm of RIVOIRA SpA (Italy) in July 1986. The plant has been completely installed and final testing is under way. The first cooling of the machine at liquid nitrogen temperature is expected to take place in spring 1989.

54005 (IPPJ-REV–3, pp. 94-98) **Tritium safety and environmental considerations in fusion studies at IPPJ.** Obayashi, Haruo (Nagoya Univ. (Japan). Inst. of Plasma Physics); Sakuma, Yoichi; Amano, Hiroshi. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. (CONF-881190–: 3. Japan-US workshop on tritium radiobiology and health physics, Kyoto (Japan), 8-10 Nov 1988). In *Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center.* Order Number DE90705927. Available from NTIS (US Sales Only), PC A14/MF A01.

In preparing the next-step experimental plans at IPPJ, considerations on the tritium safety and other environmental issues have been developed. The background quantities such as natural radiation levels and tritium concentrations have been systematically measured on the prospective site and its surroundings. Implications of the planned methods of radiation monitoring and tritium safe handling are also discussed. (author).

54006 (ORNL/FTR–3018) **[Properties of candidate materials for the ITER [International Thermonuclear Experimental Reactor]]: Foreign trip report, August 20, 1988–August 27, 1988.** Davis, J.W. Oak Ridge National Lab., TN (USA). 12 Sep 1988. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002137. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Properties of candidate materials for the ITER were discussed in detail at this meeting. It was recommended that the ITER designers used type 316L stainless steel for the first wall and blanker structures but also conduct the design studies with PCA and a low activation austenitic steel as well.

54007 (ORNL/FTR–3184) **[Evaluation of graphite as first-wall material and development of first-wall engineering for next large fusion devices]: Foreign trip report, January 31, 1989–February 9, 1989.** Davis, J.W. Oak Ridge National Lab., TN (USA). 24 Feb 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90002142. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report summarizes the results of two workshops. The first workshop held in Tokyo was intended to be an engineering workshop, while the Hokkaido meeting was intended to be a materials research meeting. It was recommended at the Hokkaido meeting that a stronger interface be created between the designers, material suppliers, and the researchers in order to focus the near-term research towards the next-generation machines.

54008 (ORNL/FTR–3409) **[Radiation damage correlation for fusion conditions]: Foreign trip report, September 25, 1989–October 3, 1989.** Grossbeck, M.L. Oak Ridge National Lab., TN (USA). 16 Oct 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001208. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The workshop consisted of formal presentations and discussions by 39 invited participants from 11 countries. The theme of the workshop was the status of techniques for correlating fusion reactor and accelerator-generated data with those expected of a fusion reactor neutron spectrum. Several papers addressed the nature of cascades induced by 14 MeV neutrons. Still others supported such studies by theoretical investigations of high-energy neutron damage. Other presentations, such as the traveler's presentation, addressed the macroscopic aspects of neutron irradiation effects, such as swelling, irradiation creep, and mechanical properties. Additional presentations addressed theoretical aspects of helium embrittlement and transmutation products in general.

54009 (ORNL/TM–11217) **Stored energy in fusion magnet materials irradiated at low temperatures.** Chaplin, R.L.; Kerchner, H.R.; Klabunde, C.E.; Coltman, R.R. Oak Ridge National Lab., TN (USA). Aug 1989. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001856. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

During the power cycle of a fusion reactor, the radiation reaching the superconducting magnet system will produce an accumulation of immobile defects in the magnet materials. During a subsequent warm-up cycle of the magnet system, the defects will become mobile and interact to produce new defect configurations as well as some mutual defect annihilations which generate heat-the release

of stored energy. This report presents a brief qualitative discussion of the mechanisms for the production and release of stored energy in irradiated materials, a theoretical analysis of the thermal response of irradiated materials, theoretical analysis of the thermal response of irradiated materials during warm-up, and a discussion of the possible impact of stored energy release on fusion magnet operation 20 refs.

54010 (ORNL/TM–11253) **Construction and initial operation of the Advanced Toroidal Facility.** Bell, G.L.; Bell, J.D.; Benson, R.D.; Bigelow, T.S.; Chipley, K.K.; Colchin, R.J.; Cole, M.J.; Crume, E.C.; Dunlap, J.L.; England, A.C.; Glowienka, J.C.; Goulding, R.H.; Harris, J.H.; Hillis, D.L.; Hiroe, S.; Horton, L.D.; Howe, H.C.; Isler, R.C.; JerniganOak Ridge National Lab., TN (USA). Aug 1989. 37p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90000978. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The Advanced Toroidal Facility (ATF) torsatron was designed on a physics basis for access to the second stability regime and on an engineering basis for independent fabrication of high-accuracy components. The actual construction, assembly, and initial operation of ATF are compared with the characteristics expected during the design of ATF. 31 refs., 19 figs., 2 tabs.

54011 (PPPL–2652) **Computation of magnetic coordinates and action-angle variables.** Reiman, A.H.; Pomphrey, N. Princeton Univ., NJ (USA). Plasma Physics Lab. 4 Oct 1989. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE90001864. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We have developed a new algorithm for calculating magnetic surfaces and coordinates for a given three-dimensional magnetic field. The algorithm serves also to solve the equivalent problem of computing invariant tori and action-angle variables for a one-dimensional time-dependent numerically specified Hamiltonian (or a two-dimensional time-independent Hamiltonian). Our approach combines features of both iterative and trajectory following methods. This allows us to overcome the inefficiency of trajectory following methods near low order rational surfaces, while retaining some of the robustness of these methods. 26 refs., 8 figs., 1 tab.

54012 (UCRL–101099) **Analysis of quench-vent pressures for present design of ITER [International Thermonuclear Experimental Reactor] TF [toroidal field] coils.** Slack, D.S. Lawrence Livermore National Lab., CA (USA). 20 Sep 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-891007–10: 13. international symposium on fusion engineering, Knoxville, TN (USA), 2-6 Oct 1989). Order Number DE90001165. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The International Thermonuclear Experimental Reactor (ITER) is a new tokamak design project with joint participation from Japan, the European Community, the Union of the Soviet Union, and the United States. This paper examines the effects of a quench within the toroidal field (TF) coils based on current ITER design. It is a preliminary, rough analysis. Its intent is to assist ITER designers while more accurate computer codes are being developed and to provide a check against these more rigorous solutions. Rigorous solutions to the quench problem are very complex involving three-dimensional heat transfer, extreme changes in heat capacities and copper resistivity, and varying flow dynamics within the conductors. This analysis addresses all these factors in an approximate way. The result is much less accurate than a rigorous analysis. Results here could be in error as much as 30 to 40 percent. However, it is believed that this paper can still be very useful to the coil designer. Coil pressures and temperatures vs time into a quench are presented. Rate of helium vent, energy deposition in the coil, and depletion of magnetic stored energy are also presented. Peak pressures are high (about 43 MPa). This is due to the very long vent path length (446 m), small hydraulic diameters, and high current densities associated with ITER's cable-in-conduit design. The effects of these pressures as well as the ability of the coil to be self protecting during a quench are discussed. 3 refs., 1 fig., 3 tabs.

54013 (UCRL–101131) **Floating data acquisition system for microwave calorimeter measurements on MTX.** Sewall, N.R. Lawrence Livermore National Lab., CA (USA). 13 Sep 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-891007–6: 13. international symposium on fusion engineering, Knoxville, TN (USA), 2-6 Oct 1989). Order Number DE90000816. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A microwave calorimeter has been designed for making 140-GHz absorption measurements on the MTX. Measurement of the intensity and spatial distribution of the FEL-generated microwave beam on the inner wall will indicate the absorption characteristics of the plasma when heated with a 140 GHz FEL pulse. The calorimeter works by monitoring changes of temperature in silicon carbide tiles located on the inner wall of the tokamak. Thermistors are used to measure the temperature of each tile. The tiles are located inside the tokamak about 1 cm outside of the limiter radius at machine potential. The success of this measurement depends on our ability to float the data acquisition system near machine potential and isolate it from the rest of the vault ground system. Our data acquisition system has 48 channels of thermistor signal conditioning, a multiplexer and digitizer section, a serial data formatter, and a fiber-optic transmitter to send the data out. Additionally, we bring timing signals to the interface through optical fibers to tell it when to begin measurement, while maintaining isolation. The receiver is an HP 200 Series computer with a serial data interface; the computer provides storage and local display for the shot temperature profile. Additionally, the computer provides temporary storage of the data until it can be passed to a shared resource management system for archiving. 2 refs., 6 figs.

54014 (UCRL–101136) **Performance of cable-in-conduit conductors in ITER [International Thermonuclear Experimental Reactor] toroidal field coils with varying heat loads.** Kerns, J.A.; Wong, R.L. Lawrence Livermore National Lab., CA (USA). 20 Sep 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-891007–15: 13. international symposium on fusion engineering, Knoxville, TN (USA), 2-6 Oct 1989). Order Number DE90001514. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The toroidal field (TF) coils in the International Thermonuclear Experimental Reactor (ITER) will operate with varying heat loads generated by ac losses and nuclear heating. The total heat load is estimated to be 2 kW per TF coil under normal operation and can be higher for different operating scenarios. Ac losses are caused by ramping the poloidal field (PF) for plasma initiation, burn, and shutdown; nuclear heating results from neutrons that penetrate into the coil past the shield. Present methods to reduce or eliminate these losses lead to larger and more expensive machines, which are unacceptable with today's budget constraints. A suitable solution is to design superconductors that operate with high heat loads. The cable-in-conduit conductor (CICC) can operate with high heat loads. One CICC design is analyzed for its thermal performance using two computer codes developed at LLNL. One code calculates the steady state flow conditions along the flow path, while the other calculates the transient conditions in the flow. We have used these codes to analyze the superconductor performance during the burn phase of the ITER plasma. The results of these analyses give insight to the choice of flow rate on superconductor performance. 4 refs., 5 figs.

54015 (UCRL–101241) **Program CICC flow and heat transfer in cable-in-conduit conductors.** Wong, R.L. Lawrence Livermore National Lab., CA (USA). 20 Nov 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-891007–14: 13. international symposium on fusion engineering, Knoxville, TN (USA), 2-6 Oct 1989). Order Number DE90001519. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Computer program CICC has been written for use in the thermofluids design of superconducting magnets for tokamak reactors, which use forced-flow, helium-cooled, cable-in-conduit conductors (CICC). In addition to background heat loads that vary with space and time, these superconductors can develop normal zones that generate electrical resistance heat. Program CICC models the transient thermodynamic and fluid-dynamic system response to background heating and normal-zone propagation in the superconductor. The computational algorithm described in this paper couples a one-dimensional, compressible pipe-flow model (including flow

choking) with two-dimensional, axisymmetric heat-conduction models of the superconductor cable, the conduit, and the epoxy-conduit insulation. National Institute of Standards and Technology helium properties are used. The model is verified by comparison with measured temperature and pressure profiles from thermal expulsion experiments. 10 refs., 9 figs.

54016 Fiber optic pressure measurement during an electromagnetic pulse. Hastings, R. (Los Alamos National Lab., NM (USA)); Leonard, E.; Powell, J. pp. 443 of OSA conference on lasers and electro-optics (1989 Technical Digest series). Optical Society of America, Washington, DC (1989). (CONF-890423–: CLEO '89: conference on lasers and electro optics, Baltimore, MD (USA), 24-28 Apr 1989).

Technical Paper WE2.

The fiber-optic Hopkinson bar technique was modified significantly to measure the development of pressure inside a vessel during the burst from a fast burst reactor. The pressure measurement required an observation of the actual pressure buildup during a burst. The experiments are being performed at the Los Alamos National Laboratory Godiva IV fast burst reactor. Godiva IV has a 30-σs burst width and produces 1.8 MJ/burst (6 X 10^{16} fissions). The pressure vessel is a graphite fiber composite vessel. The fiber optic material is a high purity single-mode fused 5-μm core fiber. The fiber is epoxied around the circumference of the graphite vessel. The stress induced in the vessel walls causes a slight stretching of the optical fiber, causing constructive and destructive interference which produces fringes when a He-Ne laser light is passed through the fibers and allowed to recombine via an interferometer. A measurement of these fringes allows one to deduce the pressure history inside the vessel.

54017 Railgun rail gouging by hypervelocity sliding contact. Barker, L.M. (Sandia National Labs., Albuquerque, NM (USA)); Trucano, T.G.; Susoeff, A.R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 83-87 (Jan 1989).

A description is given of a recently resolved mechanisms of gouging which occurs during hypervelocity sliding contact between two materials. A parameter study based on computer modeling of the gouging mechanism is presented in which gouging velocity thresholds are determined for several combinations of sliding materials. Materials which can gouge each other are found to do so only within a certain range of velocities. Related calculations of gaseous material ahead of railgun projectiles are also presented. Gun bore gouging experience with the Lawrence Livermore National Laboratory railgun project is reviewed.

54018 Continuous measurements of in-bore projectile velocity. Asay, J.R. (Sandia National Labs., Albuquerque, NM (USA)); Konrad, C.H.; Hall, C.A.; Shahinpoor, M.; Hickman, R. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 46-51 (Jan 1989).

The application of velocity interferometry to the continuous measurement of in-bore projectile velocity in a small-bore three-stage railgun is described. These measurements are useful for determining projectile acceleration and for evaluating gun performance. The launcher employed in these studies consists of a two-stage light gas gun used to inject projectiles into a railgun for additional acceleration. Results obtained for projectile velocities to 7.4 km/s with the two-stage injector are reported and potential improvements for railgun applications are discussed.

54019 High velocity contact properties. Barber, J.P. (IAP Research, Inc., 2763 Culver Ave., Dayton, OH (US)); Maas, B.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 72-74 (Jan 1989).

Electrical contacts have not been experimentally investigated at velocities above a few hundred meters per second. In this paper the authors describe a ballistic technique which can be used to measure friction coefficient and contact resistance at velocities up to several kilometers per second. The theoretical basis of the technique is described and the experimental hardware is presented.

54020 Electrothermal accelerators. Driga, M.D. (Texas Univ., Austin, TX (USA). Center for Electromechanics); Ingram, M.W.; Weldon, W.F. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 147-152 (Jan 1989).

In electrothermal (ET) guns, the projectile acceleration is governed by gas dynamics as in explosively-driven guns. In a conventional gun, however, both the energy for heating and the material to be heated are contained in the solid propellant. Electrothermal launchers allow an external electric power supply to be used to provide the necessary energy; hence, lower atomic weight propellants may be used and heated to higher temperatures while maintaining a tailored acceleration profile. Important improvements in hypervelocity performance and barrel degradation can be obtained by controlling the electric discharges via power conditioning. Complex voltage and current waveforms are achieved using complex power conditioning systems, since the existing power supplies do not conform to ET gun requirements. This paper advances the concept of a single element power supply for ET guns, showing that compulsator-type machines with waveform flexibility (pulse shaping capability) can satisfy all the ET gun power supply and conditioning requirements while maintaining a high efficiency and los mass. Additionally, compulsators are suitable for repetitive-fire applications. Also described in the paper is a system of homopolar generators (HPGs) and inductors for laboratory applications.

54021 Summary of recent results form the JAERI/US fusion neutronics phase 1 experiments. Nakamura, T.; Abdou, M.A. *Transactions of the American Nuclear Society (USA),* 52: 106-107 (1986). (CONF-860610–Summs.: American Nuclear Society annual meeting, Reno, NV (USA), 15-20 Jun 1986).

The tritium breeding ration (TBR) in a fusion blanket is one of the most important parameters to be considered in the conceptual design of fuel-self-feeding deuterium-tritium (D-T) reactors. There are many factors, both physics and engineering, that affect the TBR value in a design. Efforts in the neutronics area are to provide data needed for identifying and selecting materials and configurations that achieve an optimal TBR, and to improve the accuracy of neutronics predictions. A program is in progress on integral neutronics experiments and their analyses in the collaboration between the Japan Atomic Energy Research Institute (JAERI) and the US Department of Energy. The objectives of the program are: 1. To provide experimental data needed to determine the accuracy, guide the development, and establish the validity of the calculational methods and nuclear data bases. 2. To provide experimental data to assist in the selection, from a neutronics point of view, of configurations and materials for candidate blanket designs. The collaboration program was planned for two phases. Phase I experiments that have just been completed focused on simple blanket assemblies. Phase II experiments, scheduled to start during the summer of 1986, will be directed at more complex material arrangements and geometrical configurations. 3 refs., 2 figs.

54022 Analysis and intercomparison for phase I experiments at FNS [fusion neutron source]. Youssef, M. (Univ. of California, Los Angeles (USA)); Jung, J.; Gung, C.; Abdou, M.; Nakagawa, M.; Mori, T.; Kosako, K.; Hasegawa, A.; Nakamura, T. *Transactions of the American Nuclear Society (USA),* 52: 107-109 (1986). (CONF-860610–Summs.: American Nuclear Society annual meeting, Reno, NV (USA), 15-20 Jun 1986).

The phase I integral experiments of the Japan Atomic Energy Research Institute (JAERI)/US collaborative program on fusion breeder neutronics, which were carried out at the Fusion Neutron Source (FNS) Facility at JAERI, ranged from a deuterium-tritium neutron source characterization experiment, tritium production rate (TPR) measurements in a reference Li_2O assembly, first-wall experiments with and without coolant stimulation, and beryllium neutron multiplier experiments in various configurations. The phase II experiments of the program are planned to be carried out during FY1986-1987 when the system specifications (geometrical arrangement, material selection, etc.) are chosen to give closer simulation to the fusion reactor environment (spectra). Both the United States and JAERI have independently analyzed phase I experiments using their own data bases and codes. Analytical predictions obtained by both countries were compared to measured values. The main objective

of the intercomparison is to determine the accuracy, guide the development, and establish the validity of present computational methods and nuclear data bases in predicting key fusion blanket design parameters (e.g., TPR, heating rate, etc.) and to evaluate the overall uncertainties (both analytical and experimental) associated with these parameters. 7 refs., 2 figs.

54023 Measured neutron parameters for phase I experiments at the FNS [fusion neutron source] facility. Maekawa, H.; Nakamura, T.; Oyama, Y.; Ikeda, Y.; Yamaguchi, S.; Tsuda, K.; Oishi, K.; Porges, K.G.; Bennett, E.F.; Yule, T.J.; Dilorio, D.J. *Transactions of the American Nuclear Society (USA),* 52: 109-110 (1986). (CONF-860610–Summs.: American Nuclear Society annual meeting, Reno, NV (USA), 15-20 Jun 1986).

The objective of the phase I experiments of the Japan Atomic Energy Research Institute (JAERI)/US collaborative program on fusion neutronics is to acquire neutronic data on a large-scale system from the simple to the composite in order to examine the overall accuracy of nuclear calculations for the fusion blanket concept, by making the most use of the resources available at hand. The Fusion Neutron Source (FNS) Facility of JAERI is used in this program. In phase I experiments, the target room is assumed as the plasma chamber of a fusion reactor, and its thick shield wall as the blanket section. Neutrons from the burning plasma are simulated by those from the rotating neutron target (RNT) situated at the center of the cavity. A blanket test module is imbedded in a large experimental hold in the shielding wall. The room, RNT, and test module are treated in a set in the experimental arrangement. Once the characteristics were determined for the input neutrons entering the test region, the neutronic quantities can be measured for various configurations parametrically. The test module is composed by assembling blocks; the block structure makes it easy to modify the system and to select the detector locations. Lithium oxide of natural composition is used as the breeding material. The configuration can be changed by placing the constituent materials in front of, behind, or inside the basic plain system. Measurements were performed on absolute neutron yield calibration, angular and spatial distributions, and neutron spectra for both direct and reflected components. 3 refs., 1 fig., 1 tab.

54024 LN_2 cyclic cooling considerations of fusion ignition devices. Dabiri, A.E. (Oak Ridge National Lab., TN (USA)). *Transactions of the American Nuclear Society (USA),* 52: 138-139 (1986). (CONF-860610–Summs.: American Nuclear Society annual meeting, Reno, NV (USA), 15-20 Jun 1986).

Three preconceptual design studies have been under way in the United States for compact fusion ignition devices, all of which utilize copper magnets for toroidal field (TF) and poloidal field coils. The proposal is to operate the magnets at liquid nitrogen temperature to minimize the power requirements for the magnets. During each operating pulse, the temperature of he magnet systems is allowed to increase; no active cooling is provided during the pulse. One of the design requirements calls for cooldown between full-power pulses in some reasonable time to proved the capability for some reasonable number of operating pulses per day. A number of devices such as Alcator-A and -C have operated around liquid nitrogen temperature, but these machines have much shorter pulses and produce no neutrons. Therefore, the temperature rise during each pulse is modest, and the cooldown is less of a problem than for an ignited device with burn times of several seconds. The purpose of this study is to develop a simple model to calculate the cooldown rate of a magnet with various cooling surface configurations. The results will be useful in developing a configuration to provide the desired cooling time between pulses, which should be ~1 h or less. This analysis was applied to the inner leg of the TF coil of Ignitor, one of the ignition devices under study. The inner leg is analyzed mainly because it carries higher current densities than the outer leg and the cooling surface area is more restricted. Four cooling configuration options were studies. Here the result are reported of the most practical option in which the cooling channel is inside the TF coil. 3 refs., 1 fig., 1 tab.

54025 Plasma armature formation in high-pressure, high-velocity hydrogen. Hawke, R.S. (Lawrence Livermore National Lab., CA (USA)); Susoeff, A.R.; Asay, J.R.; Hall, C.A.; Konrad, C.H.; Hickman, R.J.; Sauve, J.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics (USA),* 25(1): 219-222 (Jan 1989).

The use of a two-stage light-gas gun (2SLGG) as a preaccelerator in combination with a railgun is expected to significantly reduce barrel ablation and improve overall performance. In particular, the use of a hydrogen 2SLGG provides injection velocities of 6 to 8 km/s and a pure hydrogen environment immediately behind the projectile as it enters a railgun. To continue acceleration of the projectile, a plasma armature must be formed. The authors explored two methods of converting a portion of the fast-moving hydrogen gas into a plasma armature capable of supporting currents exceeding 100 κA. They report on the results of these studies. This work is part of STARFIRE, the joint Sandia National Laboratories/Lawrence Livermore National Laboratory project to develop a hypervelocity railgun.

54026 (N–89-23528, pp. 281-299) **Orbital debris environment and data requirements.** Kessler, D.J. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. May 1989. (NASA-CP–3035-PT-1;L–16575-PT-1;NAS–1.55:3035-PT-1;CONF-8806434–: NASA/SDIO space environmental effects on materials workshop, Hampton, VA (USA), 28 Jun - 1 jul 1988). In *NASA/SDIO Space Environmental Effects on Materials Workshop, part 1.* Available from NTIS, PC A16/MF A01.

Orbital debris is already a major design consideration for Space Station Freedom and is becoming important to the design of unmanned spacecraft. Mathematical models predict the environment will increase with time. The amount it increases is dependent on future operations in space, and how these operations are conducted. Therefore, it is important to understand the sources of debris and which operations will minimize debris generation. This requires that debris be monitored. Currently, NASA plans to have an operational capability to monitor 1 cm debris at 500 km by 1991. However, there are currently no plans to monitor the environment of smaller debris which will be important to future spacecraft design.

54027 (AD-A–208739/3/XAB) **PASM parallel processing system: Design, simulation, and image-processing applications. Volume 1. Final report, 1 January 1986-31 December 1989.** Kuehn, J.T. Purdue Univ., Lafayette, IN (USA). School of Electrical Engineering. 31 Dec 1989. 394p. Available from NTIS, PC A17/MF A01.

Advances in device and packaging technologies are producing incremental gains in the performance of computer systems. However, these gains are being more than offset by new applications having a need to process large data sets, a need for real-time computation, or other requirements which make them prohibitively expensive to perform on conventional computer systems. This has forced computer architects to consider parallel/distributed computer designs. In Part I of this thesis, the strengths and weaknesses of a variety of existing and proposed parallel computer designs are examined. These characteristics are used to motivate and support the design decisions made for a particular parallel computer architecture, PASM. It is PASM that is the primary focus of the work in this thesis.

54028 (AD-A–209023/1/XAB) **Video Analysis Transputer Array (VATA).** Symanski, J.J.; Bromley, K.; Henderson, T. Naval Ocean Systems Center, San Diego, CA (USA). 19 Aug 1988. 10p. Available from NTIS, PC A02/MF A01.

Pub. in Proceedings of the SPIE Annual International Technical Symposium on Optical and Optoelectronic Applied Science and Engineering (32nd), Vol. 977-34(14-19 Aug 1988).

This paper presents (a) an overview of the Inmos transputer and its use in parallel arrays for image processing, (b) a functional block-level description of IBM-AT-compatible boards for signal/image processing research using transputers with reconfigurable interconnection topologies, and (c) an overview of the OCCAM and C programming tools for placing parallel algorithms onto such a processor. The hardware consists of two custom printed-circuit boards (and two commercially available boards) within an IBM-AT host. The first provides a flexible input/output interface between a general-purpose high-speed input-data bus and the transputer array. The second contains 32 transputers and 4 programmable crossbar-switch interconnection chips. Several copies of the second board can be cascaded (or even partially-unpopulated) to provide for an arbitrary number of transputer chips. Each one of these boards will perform about 128 million Whetstones or, for highly regular algorithms, a sustained 48 MFLOPS.

54029 (AD-A–209117/1/XAB) **Efficient lazy data structures on a data-flow machine. Technical report.** Heller, S.K. Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Computer Science. Feb 1989. 107p. (MIT/LCS/TR–438). Available from NTIS, PC A06/MF A01.

Eager interpreters are able to exploit vast parallelism, yet lazy interpreters have more desirable termination properties. The author proposes lazy data structures, an extension to the dataflow language Id, to support a combination of eager and lazy evaluation. The describes the semantics of lazy data-structures, as well as efficient implementation on the Tagged-Token Dataflow Architecture and the Monsoon Explicit Token Store Machine. He develop support for lazy data-structures in the language, the compiler, the run-time system, the interpreter, and the proposed hardware; and demonstrate the effectiveness of the construct as well as the limitations.

54030 (AD-A–209132/0/XAB) **Parallel vision algorithms. Annual technical report No. 2, 1 October 1987-28 December 1988.** Ibrahim, H.A.; Kender, J.R.; Brown, L.G. Columbia Univ., New York, NY (USA). Dept. of Computer Science. Jan 1989. 81p. (CUCS–415-89). Available from NTIS, PC A05/MF A01.

This Second Annual Technical Report covers the project activities during the period from October 1, 1987 through December 31, 1988. The objective of this project is to develop and implement, on highly parallel computers, vision algorithms that combine stereo, texture, and multi-resolution techniques for determining local surface orientation and depth. Such algorithms can serve as front-end components of autonomous land-vehicle vision systems. During the second year of the project, efforts concentrated on the following: first, implementing and testing on the Connection Machine the parallel programming environment that will be used to develop, implement and test our parallel vision algorithms; second, implementing and testing primitives for the multi-resolution stereo and texture algorithms, in this environment. Also, efforts were continued to refine techniques used in the texture algorithms, and to develop a system that integrates information from several shape-from-texture methods. This report describes the status and progress of these efforts. The authors describe first the programming environment implementation, and how to use it. They summarize the results for multi-resolution based depth-interpolation algorithms on parallel architectures. Then, they present algorithms and test results for the texture algorithms. Finally, the results of the efforts of integrating information from various shape-from-texture algorithms are presented.

54031 (AD-A–209265/8/XAB) **Non-rectangular sampling plan for estimating steady-state means. Technical report.** Glynn, P.W. Stanford Univ., CA (USA). Dept. of Operations Research. Aug 1988. 15p. (TR–29). Available from NTIS, PC A03/MF A01.

The method of multiple replicates is frequently used by simulators to estimate the steady-state mean of a stochastic simulation. One important advantage of this approach is that it is easily adapted to a parallel computer. Unfortunately, the method of multiple replicates is quite sensitive to contamination by initial bias. In this paper, a new type of sampling plan is described. It retains the replication flavor, yet attenuates the bias problem. It is shown that the new method reduces mean square error relative to conventional multiple replicates for problems in which the initial transient decays slowly.

54032 (AD-A–209325/0/XAB) **Expert systems and command, control, and communication system acquisition. Master's thesis.** Minnema, J.E. Naval Postgraduate School, Monterey, CA (USA). Mar 1989. 103p. Available from NTIS, PC A06/MF A01.

This thesis examines the organizational causes of the Department of Defense's (DoD) inability to acquire working defense systems. One major cause of this is identified as a lack of a sufficient number of trained and experienced acquisition personnel. An examination of the definitions of Decision Support and Expert Systems is made to determine their suitability for application to this problem. The information-system framework of Gorry and Scott Morton is used to structure the acquisition problem. The DoD acquisition problem is found to be a good candidate for the application of expert systems. An expert-system architecture is developed to provide acquisition personnel both technical and management support. Use of a central mainframe, connected to the Defense Data Network, will provide nationwide access, with centralized control of the knowledge base. The architecture allows for the incorporation of existing conventional software under expert software control. In order to reduce development cost and time, the use of existing DoD manuals as the knowledge base, is proposed. A prototype module, utilizing the M.1 expert shell and DoD Manual 4245.7-M and NAVSO P-6071 is developed to prove the feasibility of this approach.

54033 (AD-A–209364/9/XAB) **Fault-tolerant computer architecture modeling and analysis. Final technical report, August 1985-August 1988.** Kastner, M.P.; Dunham, S.R.; Pattipati, K.R.; Stueve, J.M.; Kramer, L.C. ALPHATECH, Inc., Burlington, MA (USA). Feb 1989. 313p. Available from NTIS, PC A14/MF A01.

This document is the final report. It describes a three-year research effort to develop an engineering tool capable of supporting design and analysis of large-scale, parallel, fault-tolerant computer architectures (FTCAs). The tool, a software package called Computer-Aided Performance and Reliability Evaluation System (CAPRES), allows an FTCA designer or FTCA-design evaluator to predict, by analytical means, the performance, reliability, and performability of candidate computer architectures executing candidate workloads, rather than requiring costly simulation or prototype testing for such prediction, as is currently the case. The analytic capability of CAPRES will make its most important contribution early in the system engineering cycle, when many candidate designs may appear feasible and the best is far from clear. Designers using CAPRES will be able to examine in a matter of hours or days alternatives that today take weeks or months to assess using conventional methods.

54034 (AD-A–209395/3/XAB) **Northeast Artificial Intelligence Consortium annual report, 1987. Volume 1. Executive summary. Interim report, December 1986-December 1987.** Weiss, V.; Brule, J.F. Syracuse Univ., NY (USA). Mar 1989. 38p. Available from NTIS, PC A03/MF A01.

See also Volume 2, Part A, AD-A208 344.

The Northeast Artificial Intelligence Consortium (NAIC) purpose is to conduct pertinent research in artificial intelligence and to perform activities ancillary to this research. The topics covered in general are: versatile expert system for equipment maintenance, distributed AI for communications system control, automatic photo interpretation, time-oriented problem solving, speech understanding systems, knowledge base maintenance, hardware architectures for very large systems, knowledge-based reasoning and planning, parallel structural, and optimal techniques in vision, and a knowledge acquisition, assistance, and explanation system.

54035 (AD-A–209443/1/XAB) **Parallel processing of central-difference transient analysis for three-dimensional nonlinear framed structures.** Hajjar, J.F.; Abel, J.F. Cornell Univ., Ithaca, NY (USA). Mathematical Sciences Inst. 1989. 9p. Available from NTIS, PC A02/MF A01.

Pub. in Communications in Applied Numerical Methods, Vol. 5, 39-46(1989).

The central difference algorithm is a simple but effective time-integration algorithm suitable for parallel processing. This paper discusses the development and implementation of the method for the fully nonlinear, transient dynamic analysis of three-dimensional framed structures. A data structure is presented in which only one nearest-neighbor communication is required per time step, and potentially little overhead is incurred for the parallel implementation. Because this explicit method is only conditionally stable, the large disparity of natural vibrational frequencies of framed structures indicates that central difference analysis is more useful for applications having short-duration loading. An example is presented indicating the speed-up and efficiency of the algorithm when implemented in a distributed-memory, coarse-grained parallel processing environment.

54036 (AD-A–209454/8/XAB) **Northeast Artificial Intelligence Consortium annual report, 1987. Volume 9. Computer architectures for very large knowledge bases. Interim report, December 1986-December 1987.** Berra, P.B. Syracuse Univ., NY (USA). Mar 1989. 216p. Available from NTIS, PC A10/MF A01.

See also Volume 1, AD-A209 395.

The Northeast Artificial Intelligence Consortium (NAIC) purpose is to conduct pertinent research in artificial intelligence and to perform activities ancillary to this research. This report describes progress that has been made. The topics covered in general are: versatile expert system for equipment maintenance, distributed AI for communications system control, automatic photo interpretation, time-oriented problem solving, speech-understanding systems, knowledge base maintenance, hardware architectures for very large systems, knowledge-based reasoning and planning, and a knowledge acquisition, assistance, and explanation system. The specific topic for this volume is the development of architectures for very large knowledge bases, especially in light of real time requests, parallelism, and the advent of optical computing.

54037 (AD-A–209606/3/XAB) **Multicast communication in multiprocessor systems.** Byrd, G.T.; Saraiya, N.P. Stanford Univ., CA (USA). Dept. of Computer Science. Jan 1989. 20p. (STAN-CS–89-1246). Available from NTIS, PC A03/MF A01.

Recent high-performance multiprocessors exploit cut-through routing, with packets routed as their first bytes arrive. Hardware-supported multicast can benefit the many parallel programs in which producers provide each value to multiple consumers. The authors describe several cut-through multicast protocols, including a restrictive (yet adaptive) routing scheme for deadlock avoidance. Simulations using synthetic and application-driven loads show it has significantly better performance than either multicast emulation or deadlock detection and resolution. The scheme provides cut-through multicast without requiring dedicated storage in the communication facilities for a full packet. The authors thus extend ideas considered for efficient cut-through routing in multiprocessor systems to include multicast.

54038 (ANL–87-26-Vol.4) **Proceedings of the focused research program on spectral theory and boundary value problems: Volume 4, Nonlinear differential equations.** Pieper, G.W. (ed.). Argonne National Lab., IL (USA). Aug 1989. 234p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90000920. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

This report contains papers on the following topics: Self-Intersecting Solutions of the Prescribed Mean Curvature Equation; Bounds for Vertical Points of Solutions of Prescribed Mean Curvature Type Equations, I; Large Solutions of Elliptic Equations Involving Critical Exponents; Non-Negative Solutions for a Class of Radially Symmetric Non-Positone Problems; Quenching for Semilinear Singular Parabolic Problems; Existence Results of Steady States of Semilinear Reaction-Diffusion Equations and Their Applications; Uniqueness Results for Some Nonlinear Initial and Boundary Value Problems; Uniqueness of Non-Negative Solutions of a Class of Semilinear Elliptic Equations; A Non-Oscillation Theorem for the Emden-Fowler Equation; Ground States for Semilinear Elliptic Equations with Critical Exponents; Concavity and Monotonicity Properties of Solutions of Emden-Fowler Equations; Uniqueness for a Class of Non-Linear Initial Value Problems; Oscillation of Emden-Fowler Systems; and Local and Global Properties of Solutions of Quasilinear Elliptic Equations. These papers will be indexed separately.

54039 (ANL–89/12) **Research in mathematics and computer science at Argonne: January 1988–August 1989.** Pieper, G.W. Argonne National Lab., IL (USA). Aug 1989. 70p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE90000975. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report reviews the research activities in the Mathematics and Computer Science Division at Argonne National Laboratory for the period January 1988 - August 1989. The body of the report gives a brief look at the MCS staff and the research facilities, and discusses various projects carried out in two major areas of research: analytical and numerical methods and advanced computing concepts. Projects funded by non-DOE sources are also discussed, and new technology transfer activities are described. Further information on division staff, visitors, workshops, and seminars is found in the appendices.

54040 (DOE/ER/25061–2) **A tensor product b-spline method for 3D multi-block elliptic grid generation.** Manke, J.W. Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics. Dec 1988. 24p. Sponsored by U.S. Department of Defense; U.S. DOE Energy Research. DOE Contract FG06-88ER25061. Order Number DE89017440. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We formulate a tensor product b-spline method for multi-block numerical grid generation. The Cartesian coordinate functions for a block are represented as a sum of tensor product b-spline basis functions defined on a parameter space for the block. The tensor product b-spline basis functions are constructed so that the basis functions and their first partials are continuous on the parameter space. The coordinate functions inherit this smoothness: a grid computed by evaluating the coordinate functions along constant parameter lines leads to smooth grid lines with smoothly varying tangents. The expansion coefficients for the coordinate functions are computed by solving the usual elliptic grid generation equations using simple collocation. This assures that the computed grid has the smoothness and resolution expected for an elliptic grid with appropriate control. An important result of the formulation is that the dimension of the collocation equations is the number of distinct knots for the tensor product b-spline basis functions. Combining this results with the smoothness of the b-spline representation makes it possible to reduce the dimension of the tensor product method with respect to the finite difference method, simply by using fewer knots than grid points. We formulate the expansion of the Cartesian coordinate functions as a sum of tensor product b-spline basis functions, and then we derive the collocation and boundary condition equations for the usual elliptic grid generation equations. We investigate the structure of the system of equations for the expansion coefficients and then formulate a solution algorithm to compute the coefficients. Finally, we describe the implementation of the method in a 2D multi-block grid code and discuss the performance of the method for several grids. 3 refs., 11 figs.

54041 (GA-A–19829) **ESnet/DECnet security policy, procedures and guidelines.** Caruso, D.T.; Bemis, C. Jr. General Atomics, San Diego, CA (USA). Sep 1989. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER53277;AC05-84OR21400. (CONF-8909213–1: ESNET/DECNET working group meeting, Stanford, CA (USA), 7-8 Sep 1989). Order Number DE90001009. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper presents a draft of a proposed ESnet-DECnet security manual identifying present and future DECnet security issues, including DECnet security guidelines.

54042 (INIS-mf–12006, pp. 44) **Electronics for online computers and data acquisition.** Nouvel, P.; Heck, U.; Menzer, R.; Thiel, P. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

Published in summary form only. DATA ACQUISITION SYSTEMS/electronic circuits; DEC COMPUTERS; IBM COMPUTERS; INTERACTIVE DISPLAY DEVICES; PLOTTERS; MAGNETIC DISKS; MAGNETIC TAPES; ANALOG-TO-DIGITAL CONVERTERS; CAMAC SYSTEM; TIME-TO-AMPLITUDE CONVERTERS; ON-LINE SYSTEMS; PERSONAL COMPUTERS

54043 (INIS-mf–12006, pp. 45) **Computer group.** Black, I.; Heusler, A.; Hoeptner, G.; Krafft, F.; Lang, R.; Moellenkamp, R.; Mueller, W.; Mueller, W.F.; Schmidt, A.; Schwind, D. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

The VAX-8650 has been running with no idle time during more than 98% of the time. Early in 1988 it became the boot member of a local area VAX cluster. Up to five satellites (mikroVAX II and VAXstation2000) joined the cluster building a pool of 22 disk drives. Experimences with the cluster system have shown a way to expand the capacity: Early in 1989, a second boot member (VAX3000) and several VAXstations (VAXstation2000 and VAXstation3200) will be added with additional disk space. (orig.).

54044 (INIS-mf–12006, pp. 45-46) **Development of a VAX-VMS multiparameter data acquisition system.** Kihm, T.; Knoepfle, K.T. Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.). 1989. (In German). In *Max-Planck-Institute for Nuclear Physics. Annual report 1988.* Order Number DE90711506. Available from NTIS (US Sales Only), PC A09/MF A01.

For multiparameter experiments an online data acquisition system was developed. Running on a VAX(VMS) computer it supports fast high resolution ADCs, histogramming memories and standard CAMAC modules. (orig.).

54045 (IPPJ-DT–149) **Examples of digital simulation of AC-DC power converter with the Electromagnetic Transients Program.** Tanahashi, Shugo; Yamada, Shuichi; Mugishima, Mituo; Kitagawa, Shiro. Nagoya Univ. (Japan). Inst. of Plasma Physics. Mar 1989. 52p. (In Japanese). Order Number DE90709992. Available from NTIS (US Sales Only), PC A04/MF A01.

This article gives a practical guidance for analysis of power converter circuits using the Electromagnetic Transients Program (EMTP). First how to use the program is shown with two simple examples; (1) a power supply with three-phase diode bridge and (2) a feedback system for current control. Then its application to more complicated system is shown with an example of a power supply for Compact Helical System (CHS), where a hybrid power supply with multi-phase diode and thyristor bridges, and two three-phase thyristor converters are driven by an AC generator. (author).

54046 (JAERI-M–89-068) **GRASYS: a computer program of graph synthesis system. User's manual.** Matsumoto, Kiyoshi; Kohsaka, Atsuo; Ohkubo, Shuji; Takigawa, Yoshio; Kobayashi, Hiroaki. Japan Atomic Energy Research Inst., Tokyo (Japan). May 1989. 158p. (In Japanese). Order Number DE90709991. Available from NTIS (US Sales Only), PC A08/MF A01.

A graphic synthesis system GRASYS has been developed. GRASYS has functions to create, registrate, reference and edit graphical data. On the GRASYS, a figure corresponds to a segment. The segment is a set of commands. A complex figure may be created by editing segments in a conventional mode. Time dependent graphs can also be handled as segments. Thus the user can represent the status of nuclear power plant in case of an accident. GRASYS is made as a general graph handler so that it may be used for other application. GRASYS has a sub-system, GREDIT. GREDIT has functions to handle segments on the CRT screen to create a new figure and to output a command file correspondent to the new figure on the screen. This report is a user's manual of GRASYS including GREDIT. (author).

54047 (JINR-D–17-88-95) **4. International symposium on selected topics in statistical mechanics.** Joint Inst. for Nuclear Research, Dubna (USSR). 1988. 200p. (In Russian). (CONF-8708341–: 4. international symposium on selected topics in statistical mechanics, Dubna (USSR), 25-29 Aug 1987). Order Number DE90705928. Available from NTIS (US Sales Only), PC A09/MF A01 - OSTI; INIS.

Individual papers in scope for the data base are processed separately.

54048 (K/CSD/TM–64/Rev.3) **Automated Estimating System (AES): Version 3.1, User's manual: Revision 3.** Holder, D.A. Oak Ridge Gaseous Diffusion Plant, TN (USA). Sep 1989. 87p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OT21400. Order Number DE90001869. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This document describes Version 3.1 of the Automated Estimating System, a personal computer-based software package designed to aid in the creation, updating, and reporting of project cost estimates for the Estimating and Scheduling Department of the Martin Marietta Energy Systems Engineering Division. Version 3.1 of the Automated Estimating System is capable of running in a multiuser environment across a token ring network. The token ring network makes possible services and applications that will more fully integrate all aspects of information processing, provides a central area for large data bases to reside, and allows access to the data base by multiple users. Version 3.1 of the Automated Estimating System also has been enhanced to include an Assembly pricing data base that may be used to retrieve cost data into an estimate. A WBS Title File program has also been included in Version 3.1. The WBS Title File program allows for the creation of a WBS title file that has been integrated with the Automated Estimating System to provide WBS titles in update mode and in reports. This provides for consistency in WBS titles and provides the capability to display WBS titles on reports generated at a higher WBS level.

54049 (LA-UR–89-527) **Risk assessment and LAVA's [Los Alamos Vulnerability and Risk Assessment] dynamic threat analysis.** Smith, S.T. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891064–2: 12. national computer security conference, Baltimore, MD (USA), 10-13 Oct 1989). Order Number DE89007990. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

LAVA (the Los Alamos Vulnerability/Risk Assessment system) is a three-part systematic approach to risk assessment that can be used to model risk assessment for a variety of application systems such as computer security systems, communications security systems, and information security systems. The first part of LAVA is the mathematical methodology based on such disciplines as hierarchical system theory, event-tree analysis, possibility theory, and cognitive science. The second part is the general software engine,written for a large class of personal computers, that implements the mathematical risk model. The third part is the application data sets written for a specific application system. The methodology provides a framework for creating applications for the software engine to operate upon; all application-specific information is data. Using LAVA, we build knowledge-based expert systems to assess risks in application systems comprising a subject system and a safeguards system. The subject system model comprises sets of threats, assets, and undesirable outcomes; because the threat to security systems is ever-changing, LAVA provides for an analysis of the dynamic aspects of the threat spectrum. The safeguards system model comprises sets of safeguards functions for protecting the assess from the threats by preventing or ameliorating the undesirable outcomes; sets of safeguards subfunctions whose performance determine whether the function is adequate and complete; and sets of issues that appear as interactive questionnaires, whose measures define both the weaknesses in the safeguards system and the potential costs of an undesirable outcome occurring. 29 refs.

54050 (LA-UR–89-1627) **Multiple crossbar network: Integrated supercomputing framework.** Hoebelheinrich, R. Los Alamos National Lab., NM (USA). [1989]. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891149–2: Supercomputing '89 conference, Reno, NV (USA), 13-17 Nov 1989). Order Number DE89012614. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

At Los Alamos National Laboratory, site of one of the world's most powerful scientific supercomputing facilities, a prototype network for an environment that links supercomputers and workstations

is being developed. Driven by a need to provide graphics data at movie rates across a network from a Cray supercomputer to a Sun scientific workstation, the network is called the Multiple Crossbar Network (MCN). It is intended to be coarsely grained, loosely coupled, general-purpose interconnection network that will vastly increase the speed at which supercomputers communicate with each other in large networks. The components of the network are described, as well as work done in collaboration with vendors who are interested in providing commercial products. 9 refs.

54051 (LA-UR–89-1829) **Software tools for controlling, distributing, and installing software at Los Alamos National Laboratory.** Pfaff, R.; Sanders, C.; Cohen, M. Los Alamos National Lab., NM (USA). [1989]. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891149–1: Supercomputing '89 conference, Reno, NV (USA), 13-17 Nov 1989). Order Number DE89012633. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper focuses on software tools Los Alamos National Laboratory (LANL) uses to control, distribute, and install user level software, such as language, libraries, and utilities. LANL's computing network is complex enough to represent many, if not all of the problem seen at other sites. The network keeps a system of multi-leveled security partitions separate, while integrating Cray supercomputers with both CTSS and UNICOS operating systems as well as many other types of machines such as VAXes with VMS, SUNs, and Apollos. Change control is the process by which the distribution and installation of new or changes software is controlled. Software tools have been and are being incorporated into the change control procedures to improve efficiency, reliability, and security. Tools for general management are designed to be accused from any type of computer, while tools for installing files on specific operating systems are designed to be independent. One of the new independent tools is a software package for distributing and installing UNIX™ software. This package, called CCMAKE, could be used as a basis for standardizing a way to assure that all needed files and information are included in a distribution as well as a way to install normal applications, utilities, and libraries. It therefore has the potential to benefit exchanging software between UNIX sites. 1 ref.

54052 (LA-UR–89-2974) **An efficient UNICOS run-time system for functional programs on a CRAY X-MP.** Hammes, J.P.; Yantis, B.; Michelsen, R.; Fasel, J.H. III; Fasel, P.K. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-891149–4: Supercomputing '89 conference, Reno, NV (USA), 13-17 Nov 1989). Order Number DE89016603. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The ParaGraph (Parallel Graph reduction) project at Los Alamos National Laboratory is an investigation of the use of functional languages for scientific applications; efficient implementation strategies are a primary concern. The initial version of the ParaGraph run-time system, ParaGraph-RTS 1.0, was not targeted for the X-MP architecture specifically. We examine the new Cray X-MP UNICOS single processor implementation, ParaGraph-RTS 2.0, and describe the CRAY specific optimizations employed. Optimizations include novel use of the CRAY X-MP register set and the generation of optimized assembly code. Performance improvements over ParaGraph-RTS 1.0 have been significant; initial measurements are presented. 8 refs., 4 figs.

54053 (LBL–27696) **Versatility of the CFR [Constrained Fourier Reconstruction] algorithm for limited angle reconstruction.** Fujieda, I.; Heiskanen, K.; Perez-Mendez, V. Lawrence Berkeley Lab., CA (USA). Aug 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-891087–2: IEEE nuclear science symposium and exhibits, San Francisco, CA (USA), 25-27 Oct 1989). Order Number DE90001421. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Constrained Fourier Reconstruction (CFR) algorithm and the Iterative Reconstruction-Reprojection (IRR) algorithm are evaluated based on their accuracy for three types of limited angle reconstruction problems. The CFR algorithm performs better for problems such as Xray CT imaging of a nuclear reactor core with one large data gap due to structural blocking of the source and detector pair. For gated heart imaging by Xray CT, radioisotope distribution imaging by PET or SPECT, using a polygonal array of gamma cameras with insensitive gaps between camera boundaries, the IRR algorithm has a slight advantage over the CFR algorithm but the difference is not significant. 3 refs., 5 figs.

54054 (N–89-24058) **Compiling high level constructs to distributed memory architectures. Final report.** Mehrotra, P.; Vanrosendale, J. National Aeronautics and Space Administration, Hampton, VA (USA). Inst. for Computer Applications in Science and Engineering. Mar 1989. 12p. (NASA-CR–181825;NAS–1.26:181825;ICASE–89-20). Available from NTIS, PC A03/MF A01.

Current languages for nonshared memory architectures provide a relative low-level programming environment. A set of primitives such as load balance and data distribution, which allow the programmer to express data-parallel algorithms at a higher level while also permitting control over those aspects of the program critical to performance, are described. Given such a program specification, the compiler automatically generates a distributed program containing send and receive constructs to perform interprocess communication.

54055 (ORNL/TM–11140) **A framework for studying genetic optiization of complex systems.** Liepins, G.E. Oak Ridge National Lab., TN (USA). Sep 1989. 39p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE90001848. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Although functions of interest are generally defined either on some subset of the Cartesian product of the reals or some discrete set, genetic optimization only directly addresses functions defined on diadic groups. As a result the success of genetic optimization relative to the original domain is often dependent on the chosen embedding and representation. This paper analyzes "ga hard and ga easy" functions, provides a constructive procedure (that does not use Walsh transforms) to generate hard problems, proves that no single representation is optimal for all functions, and introduces two classes of transformations to change selected hard functions into easy ones. Two procedures for representational change are suggested. 45 refs., 1 fig., 8 tabs.

54056 (ORNL/TM–11315) **Nonlinear maps with competitive interactions: Fixed-points, bifurcations, and chaotic attractors.** Scollan, D.F.; Azmy, Y.Y.; Protopopescu, V. Oak Ridge National Lab., TN (USA). Sep 1989. 70p. Sponsored by U.S. Department of Defense; U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE90001858. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

We examine several aspects of the dynamical behavior of competitive systems modeled by nonlinear maps. We analytically investigate some features of special cases of such maps, and we use the symbolic manipulator MACSYMA to derive expressions for the linearized systems' eigenvalues. These enable us to determine the linear stability of some of the fixed and periodic points of these maps, and in some cases, yield the regions of attraction in phase space. We extend the analysis to a more general form of competitive systems. The two-species one-index system and the one-species two-index map are numerically explored in search for interesting bifurcation and/or chaotic regimes over a large range of parameters. We will show that system with linear attrition displays stable, interesting behavior for a large region of parameter space even if the quadratic self-repression is taken very small. We will also show that small quadratic self-repression combined with bilinear attrition generally results in steady-state solutions with one species zero or in unbounded iterates. We describe the method used to obtain an approximate estimate of the correlation dimensions of the chaotic attractor. We also propose a new method to evaluate the correlation dimension of a chaotic attractor using statistical analysis methods. 19 refs., 31 figs., 9 tabs.

54057 (PB–89-205249/XAB) **Design and implementation of parallel MAKE.** Baalbergen, E.H. Vrije Univ., Amsterdam (Netherlands). Subfaculteit Wiskunde en Informatica. Dec 1987. 18p. (IR–141). Available from NTIS, PC EE03/MF A01.

MAKE is the standard UNIX utility for maintaining programs. UNIX programmers have been using it for almost 10 years, and

many UNIX programs nowadays are maintained by it. The strength of MAKE is that it allows the user to specify how to compile program components, and that the system, after an update, is regenerated according to the specification and with minimum number of recompilations. With the appearance of multiple-processor systems, the time needed to 'make' a program, or target, can effectively be reduced. Although the hardware provides parallelism, few tools are able to exploit the parallelism. The introduction of parallelism to MAKE is the subject of the paper. A parallel MAKE is described and an analysis of its performance is given.

54058 (PB–89-216477/XAB) **Architecturally-focused benchmarks with a communication example.** Lyon, G.E.; Snelick, R.D. National Inst. of Standards and Technology (NCSL), Gaithersburg, MD (USA). Advanced Systems Div. Mar 1989. 39p. (NISTIR–89/4053). Available from NTIS, PC A03/MF A01.

The discussion first sketches a framework of modalities for an architecturally-focused performance evaluation. The result is a hybrid of benchmarking and modeling: elements of capacity-and-use trees (CUTs) are explored as a simplified notation. There follows a description of the structure and preliminary results from a practical benchmark set for process communication. Argument is given that performance within a class of architecture is often dominated by unavoidable competitions within distinct machine modalities, such as scalar-vector. A k-alternative, forced choice defines a dimension of comparison equally well in SI- or MIMD architectures. Performance estimators are interpolations between values from basis benchmarks for modes; ideally, in the two-alternative forced choice only two benchmark measurements are needed. Refinements in basis benchmarks support CUT-based estimates of performance.

54059 (PNL-SA–17406) **The components of scientific visualization.** Desmarais, T.D. Pacific Northwest Lab., Richland, WA (USA). Oct 1989. 6p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8910103–2: Supercomputing conference, San Francisco, CA (USA), 16-20 Oct 1989). Order Number DE90001992. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The purpose of scientific visualization is to improve the ability of a human to analyze and understand data. A goal of visualization is improving productivity. If we measure the success of our visualization by measuring only the increase in productivity, we are missing a key capability of proper visualization: the improvement in our ability to discover through exploration. This paper presents a breakdown of the components that improve the success of visualization as measured in both productivity and discovery. Important concepts associated with these components are described in order to give the supercomputer user practical guidelines during construction of a visualization system. 4 refs., 1 fig.

54060 (SAND–88-2416) **Network architecture functional description and design: Version 2.0.** Stans, L.; Bencoe, M.; Brown, D.; Kelly, S.; Pierson, L.; Schaldach, C. Sandia National Labs., Albuquerque, NM (USA). 25 May 1989. 82p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE90001865. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report provides a top level functional description and design for the development and implementation of the central network to support the next generation of SNL, Albuquerque supercomputer in a UNIX® environment. It describes the network functions and provides an architecture and topology.

54061 (SAND–89-2288C) **How good is the Acme Code.** Simmons, G.J. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8908103–2: 4. joint Swedish/Soviet international workshop on information theory, Gutland (Sweden), 27 Aug - 1 sep 1989). Order Number DE90000809. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Contrary to the widely held belief that error detecting and correcting codes originated at the Bell Telephone Laboratories in the late 40's with the work of C.E. Shannon and R.W. Hamming, the Acme Commercial Code which was devised by A.C. Meisenbach in 1923 is a bona fide example of an error detecting and correcting code. In fact, Meisenbach went to considerable trouble to design his code so that there would be an efficient error correction scheme (decoder). To the authors knowledge, this is the earliest example of an error detecting and correcting code. Since the Acme code is virtually unknown today, a brief description of its intent and construction are needed in order to appreciate the title question. 4 refs.

54062 (UCRL–101911) **High performance parallel architectures.** Anderson, R.E. Lawrence Livermore National Lab., CA (USA). Sep 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-891149–7: Supercomputing '89 conference, Reno, NV (USA), 13-17 Nov 1989). Order Number DE90001055. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In this paper the author describes current high performance parallel computer architectures. A taxonomy is presented to show computer architecture from the user programmer's point-of-view. The effects of the taxonomy upon the programming model are described. Some current architectures are described with respect to the taxonomy. Finally, some predictions about future systems are presented. 5 refs., 1 fig.

54063 (WSRC-RP–89-451) **Implementation of outline software for priority management.** Miller, P.E. Westinghouse Savannah River Co., Aiken, SC (USA). 1989. 20p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-891192–1: Annual Westinghouse computer symposium, Pittsburgh, PA (USA), 6-7 Nov 1989). Order Number DE89017866. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

No matter what your profession, most busy days require that you juggle priorities – especially when an unexpected occurrence changes your plans. In spite of such priority juggling, relatively few people use computers to help them to decide on which job to do next. Such lack of this computer application is of no surprise. Consider that the human brain has a 100 billion-cell capacity. Each neuron of the brain is capable of receiving 100,000 or more signals. It is easy to understand, then, why such a powerful organizing and memory system is so apt with notebook, yellow stickies, or pad and pencil. But if you are responsible for the status or progress of as many as 25 to 200 or more jobs on a given day, then a computer with outliner software could be one of your most useful tools. Some trees in the work-jungle change overnight. Outliner software can help you to keep track of such changes that beget changes, seemingly without end. 14 figs.

54064 (WSRC-RP–89-461) **Personal computer process data acquisition.** Dworjanyn, L.O. Westinghouse Savannah River Co., Aiken, SC (USA). 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-891192–6: Annual Westinghouse computer symposium, Pittsburgh, PA (USA), 6-7 Nov 1989). Order Number DE89017877. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A simple Basic program was written to permit personal computer data collection of process temperatures, pressures, flows, and inline analyzer outputs for a batch-type, unit operation. The field voltage outputs were read on a IEEE programmable digital multimeter using a programmable scanner to select different output lines. The data were stored in ASCII format to allow direct analysis by spreadsheet programs. 1 fig., 1 tab.

54065 (WSRC-RP–89-516) **HyperCard development and implementation at SRS [Savannah River Site].** Young, M. Westinghouse Savannah River Co., Aiken, SC (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-891192–3: Annual Westinghouse computer symposium, Pittsburgh, PA (USA), 6-7 Nov 1989). Order Number DE89017868. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

HyperCard running on Apple Macintosh computers is being used in many different ways at WSRC. We currently have applications running within HyperCard that act as an expert system for new Macintosh users, we have a version of our card catalog for the 20,000 + volume technical library, as a personnel locator for our 14,000 + employee record file and as reference material for technical writers. We use HyperCard as a front end to our QA procedures and for a back end to our data acquisition systems. We often use HyperCard

as a vehicle to move data from one computer platform to another because of its comprehensive file manipulation capabilities. 8 figs.

54066 Designing arrays for modern high-resolution methods. Ballance, W.P. (Lawrence Livermore National Lab., Livermore, CA (US)); Jaffer, A.G. pp. 994 of Proceedings of the twenty-first Asilomar conference on signals, systems and computers. Chen, R.R. IEEE Service Center, Piscataway, NJ (1988). (CONF-871162–: 21. annual Asilomar conference on signals, systems, and computers, Pacific Grove, CA (USA), 2-4 Nov 1987).

A bearing estimation study of seismic wavefields propagating from a strongly heterogeneous media show that with the high-resolution MUSIC algorithm the bias of the direction estimate can be reduced by adopting a smaller aperture sub-array. Further, on this sub-array, the bias of the MUSIC algorithm is less than those of the MLM and Bartlett methods. On the full array, the performance for the three different methods are comparable. Improvement in bearing estimation in MUSIC with a reduced aperture might be attributed to increased signal coherency in the array. For methods with less resolution, the improved signal coherency in the smaller array is possibly being offset by severe loss of resolution and the presence of weak secondary sources. Building upon the characteristics of real seismic wavefields, a design language has been developed to generate, modify, and test other arrays. Eigenstructures of wavefields and arrays have been studied empirically by simulation of a variety of realistic signals.

54067 Executable assertion development for the distributed parallel environment. McMillin, B.M. (Univ. of Missouri-Rolla, Rolla, MO (US)); Ni, L.M. pp. 527 of Proceedings of COMPSAC 88: The twelfth annual international computer software and applications conference. IEEE Service Center, Piscataway, NJ (1988). (CONF-8810254–: COMPSAC '88: 12th annual international computer software and applications conference, Chicago, IL (USA), 5-7 Oct 1988).

The use of executable assertions is a powerful tool with which to perform program verification, to provide software fault-tolerance, and to provide hardware fault-tolerance via the application-oriented paradigm. In this paper the authors show that assertions commonly usd in the sequential programming environment are inadequate for the distributed parallel environment. In particular it is shown that even design based assertions are myopic and provide inadequate error coverage. In their place, a triad of basis metrics are proposed for certain classes of problems which, when applied beginning with the specification phase of the life cycle, produce assertions that are better suited to the parallel environment. This method is applied to a well-known parallel computing problem in order to demonstrate the effectiveness of the method.

54068 Calculation and visualization of turbulent flows on the Cedar multiprocessor supercomputer. Roloff, R. (Center for Supercomputing Research and Development, and Dept. of Mechanical and Industrial Engineering, UIUC, Urbana, IL (US)). pp. 1021 of Proceedings of the 1987 summer computer simulation conference. Chou, J.Q.B Society for Computer Simulation, San Diego, CA (1987). (CONF-870706–: 19. annual summer computer simulation conference, Montreal (Canada), 27-30 Jul 1987).

Turbulent flow is unsteady, chaotic, and three dimensional. The Navier-Stokes equations are generally regarded as an appropriate mathematical model; however there are no known analytic solutions for turbulent flows. A recent calculation for a model problem with simple geometry required 28 million words and 250 cpu hours on a Cray-XMP. The Cedar supercomputer project is an attempt to develop shared memory technology for multiprocessor scientific computing. Current plans envision a 32 processor machine, with computational power equivalent to a single processor Cray XMP, by the end of the year. Cedar consists of four Alliant FX/8 computers connected via a network that provides instruction synchronization and global memory access. Software that was not developed for execution on multiprocessor machines usually needs to be modified to achieve high parallel efficiency. The ability to achieve a factor of N speedup with N processors is critical. It is shown in this paper that most of the fluid mechanics algorithms in use today can be organized to achieve high parallel efficiency. Determinating the correctness of a fluid dynamics calculation requires visualization of the flow field. Sophisticated graphics capability is needed to plot the complex structures that evolve during transition from laminar flow to fully developed turbulence.

54069 INSPECTR. Kessler, T. (Expert-EASE Systems, Inc., Belmont, CA (US)); Liu, G.; Frogner, B.; Gloski, D.; Wallace, P.; Shieh, D.R. pp. 910 of Artificial intelligence and other innovative computer applications in the nuclear industry. Majumdar, M.C.; Majumdar, D.; Sackett, J.I American Nuclear Society, La Grange Park, IL (1987). (CONF-870832–: Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry: present and future, Snowbird, UT (USA), 31 Aug - 2 sep 1987).

The ability to diagnose and correct chronic performance problems at the site without waiting for expert assistance to be made available represents a significant benefit to any power plant. The INSPECTR Interactive Performance Diagnostic Assistant incorporates the latest advances in Artificial Intelligence technology (e.g. model-based reasoning and evidential reasoning with uncertainty) to address the problem of on-site diagnosis of performance problems. As a PC-based performance diagnostic expert system, INSPECTR provides a practical means of combining the analytical expertise of an experienced corporate office engineering staff with the hands-on expertise of a site-based performance engineer. Working together, INSPECTR and the performance engineer can identify, diagnose and correct performance problems that would otherwise require a significant allocation of corporate staff and/or outside consultant resources.

54070 ANS-10 standards - current status and future direction. Poetschat, G.R. *Transactions of the American Nuclear Society (USA),* 56: 266 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

The ANS-10 Standards Subcommittee is sponsored by the Mathematics and Computation Division of the American Nuclear Society (ANS). The scope of ANS-10 activities includes the development of standards that will promote effective utilization of and enhance the reliability of computer programs throughout the nuclear community. The application of ANS-10 standards during the computer program development process creates coding and documentation for the program product that promotes effective use and enhances reliability. The end product is a program package that contains adequate documentation, includes verification and validation results, is easy to use and maintain, and is easy to transfer from one hardware-software system to another.

54071 EXAP - precompiler for the GRESS and ADGEN automated sensitivity calculation systems. Horwedel, J.E.; Pin, F.G.; Worley, B.A. *Transactions of the American Nuclear Society (USA),* 56: 301-302 (1988). (CONF-880601–: American Nuclear Society annual meeting, San Diego, CA (USA), 12-16 Jun 1988).

In recent years, two automated systems have been developed that add derivative taking capability to existing FORTRAN codes. The derivative information is used to calculate sensitivities of model results to input data. The two systems, GRESS and ADGEN, solve the forward and adjoint sensitivity problems, respectively. Both systems are based on a precompiler that automates the calculation of derivatives of the real variable on the left-hand-side (LHS) of each equation with respect to the real variables on the right-hand-side (RHS) of each equation. This paper describes the features of the extended arithmetic processor (EXAP) precompiler that makes the automation of differentiation capability practical.

54072 (ETDE-IT–89-10) **Towards the intelligent plant.** D'Ambrosio, A.; Serventi, A. Ansaldo S.p.A., Genoa (Italy). Nov 1987. 8p. (CONF-8711245–8: Workshop on computers applications for nuclear powers and industrial process plant operation and control, Rome (Italy), 19-20 Nov 1987). Order Number DE89793126. Available from NTIS (US Sales Only), PC A02.

The application of Knowledge Based Systems (KBS) in nuclear power and industrial plants is currently under development at ANSALDO (Italy) Eng. R&D in collaboration with APEIRON, consulting in Expert System (ES) design and development. A most important objective is to get from the stage of stand-alone systems

to their integration within industrial plants. The integration of ES's is engineered to make the resulting system able to deal with different tasks (diagnosis, control, planning, etc.). Methodologies and tools for ES integration must be so developed to be general with respect to different application domains; this will bring a decrease in engineering costs thereby making the technology competitive and evermore popular.

54073 (INIS-BR–1664) **Scientific and technical production of Ipen - 1988.** Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Div. de Informacao e Documentacao Cientificas. 1989. 61p. (In Portuguese). Order Number DE90606936. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

This bulletin shows the papers done by the Ipen's researches during the 1988. In the appendix, the papers published since 1985 to 1987 are presented. The references are grouped by publications types. (author).

54074 (N–89-23528, pp. 161-175) **EnviroNET: Space environment for Strategic Defense Initiative experiments.** Lauriente, M. National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center. May 1989. (NASA-CP–3035-PT-1;L–16575-PT-1;NAS–1.55:3035-PT-1;CONF-8806434–: NASA/SDIO space environmental effects on materials workshop, Hampton, VA (USA), 28 Jun - 1 jul 1988). In *NASA/SDIO Space Environmental Effects on Materials Workshop, part 1.* Available from NTIS, PC A16/MF A01.

EnviroNET is an operational system available to the Strategic Defense Initiative (SDI) experimenters who have access to a terminal or dial-up port. It is a tail node on Space Physics Analysis Network (SPAN) accessible directly or through the national networks via NPSS. Some of the benefits to using EnviroNET include: validated NASA environmental information and interactive space models; facilitating the payload integration process; easy access to expert assistance; and potential for time and cost savings.

54075 (PB–89-868400/XAB) **Supervisory control and data acquisition (SCADA). January 1977-July 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities database). Report for January 1977-July 1989.** National Technical Information Service, Springfield, VA (USA). Aug 1989. 95p. Available from NTISPC N01/MF N01.

Supersedes PB–87-852893.

This bibliography contains citations concerning the design, standards and implementation, and performance evaluations of supervisory control and data acquisition (SCADA) systems for industrial control and monitoring processes. Topics include distributed process control, batch processing, load-management systems, centralized control, fault isolation, and real-time control. Applications in manufacturing, electric-utility distribution networks, domestic water supply remote monitoring, oil and natural gas pipeline distribution and fault isolation, and telecommunication networks are presented. (This updated bibliography contains 207 citations, 112 of which are new entries to the previous edition.)

54076 (WSRC-RP–89-467) **Training Management Information System.** Rackley, M.P. Westinghouse Savannah River Co., Aiken, SC (USA). [1989]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-891192–4: Annual Westinghouse computer symposium, Pittsburgh, PA (USA), 6-7 Nov 1989). Order Number DE89017870. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Training Management Information System (TMIS) is an integrated information system for all training related activities. TMIS is at the leading edge of training information systems used in the nuclear industry. The database contains all the necessary records to confirm the department's adherence to accreditation criteria and houses all test questions, student records and information needed to evaluate the training process. The key to the TMIS system is that the impact of any change (i.e., procedure change, new equipment, safety incident in the commercial nuclear industry, etc.) can be tracked throughout the training process. This ensures the best training can be performed that meets the needs of the employees. TMIS is comprised of six functional areas: Job and Task Analysis, Training Materials Design and Development, Exam Management, Student Records/Scheduling, Evaluation, and Commitment Tracking. The system consists of a VAX 6320 Cluster with IBM and MacIntosh computers tied into an ethernet with the VAX. Other peripherals are also tied into the system: Exam Generation Stations to include mark sense readers for test grading, Production PC's for Desk-Top Publishing of Training Material, and PC Image Workstations. 5 figs.

54077 (WSRC-RP–89-472) **Procurement of an optical disk information storage and retrieval system.** Hudson, B.J. Westinghouse Savannah River Co., Aiken, SC (USA). [1989]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC09-89SR18035. (CONF-891192–16: Annual Westinghouse computer symposium, Pittsburgh, PA (USA), 6-7 Nov 1989). Order Number DE90001372. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

There are a number of factors that affect the decision to buy an optical disk based system for records management or information retrieval. Systems that are currently offered may be aimed at certain markets or specialized needs. The prospective buyer of an image storage system must perform a thorough requirements analysis to determine his needs. This presentation will discuss the following issues and their impact on the system requirements: Volume of records; Scanning workloads; Photographs/halftones; Standalone vs network; Use of existing index systems; Growth paths, integration to network; Legal, DOE considerations; Who are your users; Types of records; Retrieval workloads; Oversize documents; Use of existing workstations; Image quality vs file sizes; Proprietary vs standard components; Records vs information; and What is your justification. 1 fig.

54078 (AD-A–209447/2/XAB) **SDS (strategic defense system) software testing and evaluation: A review of the state-of-the-art in software testing and evaluation with recommended R & D (research and development) tasks. Final report.** Youngblut, C.; Brykczynski, B.R.; Salasin, J.; Gordon, K.D.; Meeson, R.N. Institute for Defense Analyses, Alexandria, VA (USA). Feb 1989. 166p. (IDA-P–2132). Available from NTIS, PC A08/MF A01.

This document identifies the technology required for effective and efficient testing and evaluation of Strategic Defense System (SDS) software. This document provides an overview of current testing and evaluation technology, a mapping of available technology against SDS needs, and recommendations to close critical gaps in technology.

54079 (N–89-24443) **Summary and evaluation of the Strategic Defense Initiative space power architecture study.** Edenburn, M.; Smith, J.M. National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center. Mar 1989. 418p. (NASA-TM–102012;E–4724;NAS–1.15:102012). Available from NTIS, PC A18/MF A01.

The Space Power Architecture Study (SPAS) identified and evaluated power subsystem options for multimegawatt electric (MMWE) space based weapons and surveillance platforms for the Strategic Defense Initiative (SDI) applications. Steady state requirements of less than 1 MMWE are adequately covered by the SP-100 nuclear space power program and hence were not addressed in the SPAS. Four steady state power systems less than 1 MMWE were investigated with little difference between them on a mass basis. The majority of the burst power systems utilized H(2) from the weapons and were either closed (no effluent), open (effluent release) or steady state with storage (no effluent). Closed systems used nuclear or combustion heat source with thermionic, Rankine, turboalternator, fuel cell and battery conversion devices. Open systems included nuclear or combustion heat sources using turboalternator, magnetohydrodynamic, fuel cell or battery power conversion devices. The steady state systems with storage used the SP-100 or Star-M reactors as energy sources and flywheels, fuel cells or batteries to store energy for burst applications. As with other studies the open systems are by far the lightest, most compact and simplist (most reliable) systems. However, unlike other studies the SPAS studied potential platform operational problems caused by effluents or vibration.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

Short sample testing facility for the Superconducting Super Collider: Requirements and development status, 14:53034 (R;US)
The HISS TPC, 14:53086 (R;US)
The influence of residual contamination on the structure and properties of metal/GaAs interfaces, 14:52954 (R;US)
The strength-toughness combination of the aluminum-lithium alloys 2090 and 2091 at cryogenic temperatures, 14:52553 (R;US)
Thermal and statistical properties of nuclei and nuclear systems, 14:53841 (R;US)
Versatility of the CFR [Constrained Fourier Reconstruction] algorithm for limited angle reconstruction, 14:54053 (R;US)

Lawrence Livermore National Lab., CA (USA)
17.1 GHz free-electron laser as a microwave source for TeV colliders, 14:53039 (R;US)
A detailed kinetic and thermodynamic model of petroleum formation, destruction, and expulsion, 14:51733 (R;US)
A study of the difference between gravimetric and gamma-gamma density near the surface in northern Yucca Flat, 14:53572 (R;US)
Analysis of nitrogen-pulsed sputtered beryllium, 14:52578 (R;US)
Analysis of quench-vent pressures for present design of ITER [International Thermonuclear Experimental Reactor] TF [toroidal field] coils, 14:54012 (R;US)
Anharmonic betatron motion in free electron lasers, 14:52978 (R;US)
Annual Technology Review, 1988: Hazards Control Department, 14:52394 (R;US)
Assessing multiple pathway exposures: Variability, uncertainty, and ignorance, 14:53556 (R;US)
Beam research technical abstracts, 1988, 14:52967 (R;US)
Consequences of dynamic and phase space constraints in medium energy heavy ion collisions, 14:53844 (R;US)
Cooperative, multi-disciplinary problem solving for chemical accidents, 14:53230 (R;US)
Diode calibration manual, 14:53208 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Summary report, 14:53198 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 1, Detailed report, 14:53199 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 2, Appendices A–D, 14:53200 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 3, Appendix E, Water spray test data, 14:53201 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 5, Appendix G, Aerosol measurements, 14:53202 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 6, Appendix H, Selected still photographs, 14:53203 (R;US)
Energy and Technology Review, July–August 1989, 14:53132 (R;US)
Environmental collaborations in the use of Accelerator Mass Spectrometry, 14:53118 (R;US)
Evaluation of an emergency response model with instantaneous air concentrations during stable conditions: Revision 1, 14:53209 (R;US)
Floating data acquisition system for microwave calorimeter measurements on MTX, 14:54013 (R;US)
High performance parallel architectures, 14:54062 (R;US)
In-situ equivalent CO_2 estimates using a neutron-induced gamma-ray spectroscopy logging system, 14:53134 (R;US)
Interlaboratory comparison of radiation-induced attenuation in optical fibers: Part 3, Transient exposures, 14:52662 (R;US)
Irreversible processes from reversible mechanics, 14:53660 (R;US)
Laboratory x-ray lasers, 14:52907 (R;US)
LLNL [Lawrence Livermore National Laboratory] research on cold fusion, 14:53927 (R;US)
Mechanistic modeling of epoxy resins, 14:52663 (R;US)
Nuclear criticality safety assessment calculations: Part 1, Calculating power histories in nuclear excursions, 14:52327 (R;US)
Path integral simulations of liquid helium, 14:53653 (R;US)
Performance of cable-in-conduit conductors in ITER [International Thermonuclear Experimental Reactor] toroidal field coils with varying heat loads, 14:54014 (R;US)
Program CICC flow and heat transfer in cable-in-conduit conductors, 14:54015 (R;US)
Propagation of detonation waves from an impact region, 14:53125 (R;US)
Remedial investigation of landfill Pit 8 Lawrence Livermore National Laboratory Site 300, 14:53229 (R;US)
Some neutron and photon reactions on the ground and isomeric states of $^{236,237}Np$, 14:53819 (R;US)
Spectroscopic and laser properties of $Cr:LiCaA1F_6$ and $Cr:LiSrA1F_6$ crystals, 14:52908 (R;US)
Sub-structuring lattice gases, 14:53661 (R;US)
Synthesis and characterization of krypton and xenon clathrate complexes, 14:52834 (R;US)
The current status of x-ray conversion efficiency modeling, 14:52906 (R;US)
The glycophorin A assay for somatic cell mutations in humans, 14:53300 (R;US)
The somatic mutational component of human carcinogenesis, 14:53302 (R;US)
Verification of the NIKE3D structural analysis code by comparison against the analytic solution for a spherical cavity under a far-field uniaxial stress, 14:51779 (R;US)

Lightwave Electronics Corp., Mountain View, CA (USA)
Prototype laser-diode-pumped solid state laser transmitters. Final report, April 1987-June 1989, 14:52905 (R;US)

Los Alamos National Lab., NM (USA)
A memorial colloquium honoring Herbert L. Anderson, 14:52277 (R;US)
A quasi-economic role for lunar science, 14:53601 (R;US)
Algebraic description of intrinsic modes in nuclei, 14:53840 (R;US)
An efficient UNICOS run-time system for functional programs on a CRAY X-MP, 14:54052 (R;US)
Chaotic behavior in nonlinear polarization dynamics, 14:53923 (R;US)
Dynamical properties from quantum Monte Carlo by the Maximum Entropy Method, 14:53895 (R;US)
General many-body systems, 14:53897 (R;US)
Heat and mass transfer design issues in PEM fuel cell hardware, 14:52431 (R;US)
In situ measurements of neutron multiplying systems, 14:51742 (R;US)
Ion beam analysis and modification of thin-film, high-temperature superconductors, 14:52621 (R;US)
Lepton-pair production in hadron-nucleus collisions, 14:53677 (R;US)
Migration of fission products at the Nevada Test Site: Detection with an isotopic tracer, 14:53241 (R;US)
Monitoring chaos of cardiac rhythms, 14:53415 (R;US)
Multiple crossbar network: Integrated supercomputing framework, 14:54050 (R;US)
Optical solitons in liquid crystals, 14:53896 (R;US)
QCD [Quantum Chromo-Dynamics] with dynamical fermions on the connection machine, 14:53731 (R;US)
Risk assessment and LAVA's [Los Alamos Vulnerability and Risk Assessment] dynamic threat analysis, 14:54049 (R;US)
Software tools for controlling, distributing, and installing software at Los Alamos National Laboratory, 14:54051 (R;US)
Strengthening mechanisms of tungsten powder reinforced uranium, 14:52551 (R;US)
The analyses of neutron coincidence data to verify both spontaneous-fission and fissionable isotopes, 14:51877 (R;US)
The softest Einstein AGN [active galactic nuclei], 14:53599 (R;US)
The Yucca Mountain Project Prototype Testing Program: 1989 Status report, 14:51765 (R;US)
Thermonuclear Runaway model, 14:53600 (R;US)
Use of superconducting plates and shells to deflect magnetic noise fields: Application to MEG [magnetoencephalography], 14:53406 (R;US)
Water supply at Los Alamos during 1988: Progress report, 14:53568 (R;US)
Workshop results on small-period wiggler designs, 14:52902 (R;US)

Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Physics and Astronomy
Electron collisions with positive ions: Progress report, April 1, 1987–March 31, 1990, 14:53639 (R;US)

Louisville Univ., KY (USA)
Spectroscopic studies of hydrogen atom and molecule collisions: Progress report, 14:53640 (R;US)

Lund Univ. Hospital (Sweden). Dept. of Oncology
ADPRT inhibitors and hyperthermia as radiosensitizers. Mechanistic studies using human leukocytes in vitro and a C3H mouse mammary carcinoma in vivo, 14:53407 (R;SE)

M

Martin Marietta Energy Systems, Inc., Piketon, OH (USA)
Long-Range Environmental and Waste Management Plan, fiscal years 1989–1995, 14:52384 (R;US)

Maryland Univ., College Park, MD (USA). Dept. of Chemistry and Biochemistry
Radioactive decay and nuclear structure studies: Progress report, October 1, 1988–September 30, 1989, 14:53776 (R;US)

Maryland Univ., College Park, MD (USA). Dept. of Physics and Astronomy
High energy accelerator and colliding beam user group: Progress report, March 1, 1989–February 28, 1990, 14:53668 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA)
Radiation damage microstructures in nuclear ceramics with applications in fusion energy technology and nuclear waste disposal: Final technical report, 14:52613 (R;US)
Tunable microwigglers for free-electron lasers, 14:52895 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Computer Science
Efficient lazy data structures on a data-flow machine. Technical report, 14:54029 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Mfg. and Productivity
Tribology of undulated surfaces. Final report, 1 February 1986-31 January 1989, 14:52934 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center
Ion collection by probing objects in flowing magnetized plasmas, 14:53932 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Research Lab. of Electronics
High-repetition-rate femtosecond dye amplifier using a laser-diode-pumped neodymium:YAG laser, 14:52942 (R;US)
Traps for neutral atoms. Annual summary report, 1 September 1987-31 August 1988, 14:53636 (R;US)

Massachusetts Univ., Amherst, MA (USA)
Climate system research studies of global and regional instrumental data: Progress report for period December 1, 1988–November 30, 1989, 14:53152 (R;US)

Massachusetts Univ., Amherst, MA (USA). Dept. of Forestry and Wildlife Management
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North Atlantic): Rainbow smelt, 14:53250 (R;US)

Max-Planck-Institut fuer Kernphysik, Heidelberg (Germany, F.R.)

Adaptability in chemical engineering, 14:52373 (R;US)
Atomic Data for Fusion: Volume 6, Spectroscopic data for titanium, chromium, and nickel: Volume 2: Chromium, 14:53955 (R;US)
BES welding science contractors summary report, 1988–89, 14:52573 (R;US)
Bibliography of fusion product physics in tokamaks, 14:53959 (R;US)

Building Thermal Envelope Systems and Materials (BTESM) and research utilization/technology transfer progress report for DOE Office of Buildings and Community Systems: Monthly progress report, 14:52454 (R;US)

Ceramic Technology for Advanced Heat Engines Project: Semiannual progress report for October 1988–March 1989, 14:52624 (R;US)

Characteristics of an electron-beam rocket pellet accelerator, 14:53987 (R;US)

Characteristics of CMOS analog integrated structures using MOSIS [Metal Oxide Semiconductor Implementation System], 14:52950 (R;US)

Characterization of the ORNL [Oak Ridge National Laboratory] Biology Area process wastewater, 14:53256 (R;US)

Comprehensive self-assessment and upgrade program progress report for the period January 1–June 30, 1989, 14:52395 (R;US)

Construction and initial operation of the Advanced Toroidal Facility, 14:54010 (R;US)

Deformation and fracture of low alloy steels at high temperature: Final report, May 1, 1982–April 30, 1985, 14:51650 (R;US)

Design and development of a fast-response ionization gauge controller, 14:53995 (R;US)

Direction-dependent stopping power and beam deflection in anisotropic solids, 14:53859 (R;US)

Eddy-current inspection of shuttle heat exchanger tube welds, 14:52935 (R;US)

Electromagnetic Pulse (EMP) survey of the Louisiana State Emergency Operating Center, Baton Rouge, Louisiana, 14:53131 (R;US)

Environmental surveillance data report for the first quarter of 1989, 14:53243 (R;US)

Filtration of Oak Ridge National Laboratory simulated liquid low-level waste, 14:51768 (R;US)

Fusion reactor materials: Semiannual progress report for the period ending March 31, 1989, 14:54002 (R;US)

Guide for estimating differences in building heating and cooling energy due to changes in solar reflectance of a low-sloped roof, 14:52450 (R;US)

Identification of materials for hot-gas filter tubesheets: Period of performance: October 1, 1988–October 1, 1989, 14:51620 (R;US)

Implementation of a multimodular LMR [liquid metal cooled nuclear reactor] nuclear plant simulation on a parallel computer, 14:52203 (R;US)

Implementation of blower door and new client selection concepts into the Iowa Weatherization Assistance Program: Experimental plan, 14:52452 (R;US)

Independent-particle model for fusion in cluster impact, 14:54001 (R;US)

Initial effects of nuclear weapon x-radiation on the LAMPSHADE orbital debris satellite shield, 14:53114 (R;US)

Insulation interlaminar shear strength testing with compression and irradiation, 14:53992 (R;US)

Integrating and enhancing tools for ASIC [application-specific integrated circuits] design using MOSIS [Metal Oxide Semiconductor Implementation Service] fabrication, 14:52949 (R;US)

Inter-institutional decision making in the technology transfer process: Some preliminary issues in the evaluation of ORNL's High-Temperature Superconductivity Pilot Center, 14:52393 (R;US)

Interaction of low-energy electrons and positrons with condensed matter: Stopping powers and inelastic mean free paths from optical data, 14:53860 (R;US)

Ion beam processing of advanced electronic materials, 14:52538 (R;US)

ITER [International Thermonuclear Experimental Reactor] reactor building design study, 14:53993 (R;US)

Laboratory study of the dynamic losses of a single speed, split system air-to-air heat pump having tube and plate fin heat exchangers, 1985–1986, 14:52451 (R;US)

Licensee Event Report (LER) compilation for month of August 1989, 14:52230 (R;US)

Literature review of workability and phase stability relative to advanced austenitic alloys in steam service, 14:51652 (R;US)

Maintenance Information and Data Acquisition System (MIDAS), 14:53113 (R;US)

Minimization of chromium-contaminated wastewater at a plating facility in the Eastern United States, 14:53139 (R;US)

Nevada applied ecology group publications, 14:53225 (R;US)

Nickel beryllides and their properties, 14:52537 (R;US)

Nonlinear maps with competitive interactions: Fixed-points, bifurcations, and chaotic attractors, 14:54056 (R;US)

Oil vulnerability and intermediate price fluctuations: A preliminary assessment and proposal, 14:52416 (R;US)

Operation and reliability of a pneumatic hydrogen pellet injection system on the Joint European Torus, 14:53998 (R;US)

ORNL underground storage tank management guide, 14:51766 (R;US)

Particle exhaust schemes in the DIII-D advanced divertor configuration, 14:53991 (R;US)

Potential applications of an electron cyclotron resonance multicusp plasma source, 14:54000 (R;US)

Potential applications of structural ceramic composites in gas turbines: Final report, 14:52146 (R;US)

Powdering characteristics of a thin film evaporator: Drying and powdering of a solution, 14:51769 (TJ;US)

Preliminary site survey report for the former Elza Gate warehouse area, Oak Ridge, Tennessee, 14:53244 (R;US)

Preparative-scale proteins seperations by continuous annular chromatography, 14:52761 (R;US)

Prospects for wavelength tunable lasers based on vacancy defects in alkaline-earth oxides, 14:52897 (R;US)

RASCAL [Radiological Assessment System for Consequence Analysis] Version 1.3 user's guide, 14:52280 (R;US)

Resource Conservation and Recovery Act ground-water monitoring projects for Hanford facilities: Progress report, April 1–June 30, 1989, 14:53228 (R;US)
The components of scientific visualization, 14:54059 (R;US)
The design and use of an electrically driven core sampler capable of obtaining marine sediment cores through dense substrates, 14:53571 (R;US)

Paducah Gaseous Diffusion Plant, KY (USA)
Cracking of 1-inch UF_6 cylinder valve packing nuts: The effects of packing nut torque on stem seal leakage and packing nut stress due to thermal expansion of the PTFE stem seal rings, 14:52550 (R;US)

Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire
Bogomol'nyi bounds for cosmic strings, 14:53596 (R;FR)
Excitation of giant resonances in heavy ion reactions at intermediate energies, 14:53646 (R;FR)
New UA4 rho ^{a}ntip^{p} datum and the odderon, 14:53704 (R;FR)
Spin-flip transitions in ^{46}Ti, ^{48}Ti and ^{50}Cr excited by inelastic proton scattering, 14:53647 (R;FR)
Study and performances of the SPES III detector, 14:53084 (R;FR;In French)

Pennsylvania State Univ., University Park, PA (USA). Coll. of Earth and Mineral Sciences
Thermal stability of jet fuel: Quarterly report, April–June 1989, 14:51719 (R;US)

Pennsylvania Univ., Philadelphia, PA (USA). Dept. of Biochemistry and Biophysics
[Electron transfer mechanisms in reaction centers]: Final progress report, 14:52056 (R;US)

Pennsylvania Univ., Philadelphia, PA (USA). Dept. of Physics
Inverse scattering: Ionospheric structure determination. Final technical report, 1 July 1979-30 June 1980, 14:53620 (R;US)

Pentek, Inc., Coraopolis, PA (USA)
Robotics program development: Applicable lessons learned from TMI-2: Final report, 14:52300 (R;US)

Pisa Univ. (Italy)
Optimal control of photovoltaic systems by a new battery state-of-charge observer, 14:52105 (R;IT)
Two phase cooling of large-diameter power thyristors, 14:52951 (R;IT)
Two-phase thermosyphon device for the large thyristor cooling, 14:52952 (R;IT)

Pittsburgh Univ., PA (USA)
The Allegheny Observatory search for planetary systems. Final technical report, 1980-1988, 14:53608 (R;US)

Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering
Studies of dense phase cohesive coal transport in plugs: Quarterly report, July–September 1989, 14:51694 (R;US)

Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Quimica
Intercalated compounds of niobium and tantalum dicalcogenides, 14:52726 (R;BR;In Portuguese)
Irradiation effects in fused quartz 'Suprasil' as a detector of fission fragments under high flux of reactor neutrons, 14:52253 (R;BR;In Portuguese)
Selenium determination in biological material by atomic absorption spectrophotometry in graphite furnace and using vapor generation, 14:52725 (R;BR;In Portuguese)

Praxis Engineers, Inc., Milpitas, CA (USA)
Coal surface control for advanced fine coal flotation: Quarterly report, April 1, 1989–June 30, 1989, 14:51619 (R;US)

Princeton Univ., NJ (USA). Plasma Physics Lab.
Computation of magnetic coordinates and action-angle variables, 14:54011 (R;US)

Purdue Univ., Lafayette, IN (USA). Dept. of Chemistry
The role of mobile ions in fast ion conducting systems and high-impact strength ceramics: Progress report, August 1, 1987–March 1, 1988, 14:52614 (R;US)

Purdue Univ., Lafayette, IN (USA). Joint Highway Research Project
Material characterization of hot-mix recycled bituminous pavements. Final report, 14:52494 (R;US)
Material characterization of hot-mix recycled bituminous pavements. Executive Summary, 14:52495 (R;US)

Purdue Univ., Lafayette, IN (USA). School of Electrical Engineering
PASM parallel processing system: Design, simulation, and image-processing applications. Volume 1. Final report, 1 January 1986-31 December 1989, 14:54027 (R;US)

Q

Quantex Corp., Rockville, MD (USA)
Innovation in photoelectrodes for the splitting of water, 14:52029 (R;US)

R

R and D Associates, Marina del Rey, CA (USA)
Emerging high-frequency (HF) and related radio-communications concepts for enduring C(3)I roles in a nuclear war environment: Critical issues in nuclear weapons effects on propagation. Topical report, 5 January-1 June 1980, 14:53129 (R;US)
Nuclear-survivable C(3) system design. Technical report, 14:53130 (R;US)

Radian Corp., Research Triangle Park, NC (USA)
Quality-assurance procedures: Method 28 certification and auditing of wood heaters, 14:52456 (R;US)
Quality-assurance procedures: Method 5G determination of particulate emissions from wood heaters from a dilution tunnel sampling location, 14:52457 (R;US)

Radian Corp., Sacramento, CA (USA)
Air-toxics technical assistance for the state of Alaska. Final report, 14:53184 (R;US)

Radiation Effects Research Foundation, Hiroshima (Japan)
Comparison of the dose-response relationships for chromosome aberration frequencies between the T65D and DS86 dosimetries, 14:53539 (R;JP;In Japanese, English)
Whole-blood phagocytic and bactericidal activities of atomic bomb survivors, Hiroshima and Nagasaki, 14:53538 (R;JP)

RCG/Hagler, Bailly, Inc., Washington, DC (USA)
US building materials industry: R and D barriers assessment, 14:52455 (R;US)

Regis Coll., Weston, MA (USA). Research Center
Auroral E-fields from DE-1 and -2 at magnetically conjugate points, 14:53622 (R;US)

Remediation Technologies, Inc., Pittsburgh, PA (USA)
Fuel-use options for the management of MGP (manufactured gas plant) site wastes. Topical report, June-December 1987, 14:51654 (R;US)

Rensselaer Polytechnic Inst., Troy, NY (USA)
Characteristics of liquid-phase-sintered tungsten heavy alloys, 14:52532 (R;US)
High-temperature photochemistry kinetics studies of the reactions of H(1(2)s) and D(1(2)S) with N_2O, 14:52836 (R;US)

Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Mechanical Engineering
Solid lubrication studied by optical means. Final report, 1 March 1986-28 February 1989, 14:52933 (R;US)

Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA)
Nevada test site low-level and mixed waste repository design in the unsaturated zone, 14:51754 (R;US)

Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 45 t/h steam boiler fueled with heavy oil, 14:53188 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 25 t/h steam boiler fueled with heavy oil, 14:53189 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a circulating fluidized-bed system, 14:53192 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a brown-coal-fueled power plant boiler, 14:52154 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on an interlaboratory study on the precision of chemical methods of heavy metal and trace element analysis, 14:53196 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements, 14:53197 (R;DE;In German)

Rochester Gas and Electric Corp., NY (USA)
Demonstration of reliability-centered maintenance: Volume 3: First annual progress report from Ginna Nuclear Sation, 14:52299 (R;US)

Rochester Univ., NY (USA)
Nuclear structure theory: Technical progress report, September 1, 1988–August 31, 1989, 14:53822 (R;US)

Rochester Univ., NY (USA). Dept. of Physics and Astronomy
A combined analysis of SLAC [Stanford Linear Accelerator Center] experiments on deep ineleastic e-p and e-d scattering, 14:53671 (R;US)
Production of hybrid mesons in the nuclear Coulomb field, 14:53672 (R;US)

Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant
Compatibility coding of liquid hazardous waste, 14:51775 (R;US)

Rome Univ. (Italy)
Prediction of leakage mass flow rate through gas springs, 14:52513 (R;IT)

Rutherford Appleton Lab., Chilton (UK)
Application of the specular reflection of neutrons to the study of surfaces and interfaces, 14:53903 (R;GB)
ATLAS - analysis of time-of-flight diffraction data from liquid and amorphous samples. Version 1.0, 14:53902 (R;GB)
Charm quark contribution to the W and Z cross sections at pp-bar colliders, 14:53709 (R;GB)
Electronics readout system for the OPAL Vertex Drift Chamber, 14:53091 (R;GB)

S

San Diego State Univ., CA (USA). Dept. of Electrical and Computer Engineering
Photodetachment cross sections of negative halogen ions in discharge media, 14:53633 (R;US)

San Diego Supercomputer Center, CA (USA)
Position-sensitive CdTe detector using improved crystal growth method. Final report, 14:53087 (R;US)

Sandia National Labs., Albuquerque, NM (USA)
200 MeV, fast neutron and gamma ray effects on AlGaAs/GaAs HEMTs [high electron mobility transistors], 14:53098 (R;US)
A description and status of the Yucca Mountain Project repository sealing program, 14:51778 (R;US)
A radar simulation program for a 1024-processor hypercube, 14:53116 (R;US)
A reference manual for the Event Progression Analysis Code (EVNTRE), 14:52336 (R;US)
A review of gas-cooled reactor concepts for SDI [Strategic Defense Initiative] applications, 14:52195 (R;US)
A sensitivity analysis of flow through layered, fractured tuff: Implications for performance allocation and performance assessment modeling, 14:51777 (R;US)
Analysis of core damage frequency: Grand Gulf, Unit 1 internal events, 14:52334 (R;US)
Analysis of core damage frequency: Grand Gulf, Unit 1 internal events appendices, 14:52335 (R;US)
Analytical framework for the LIFE2 computer code, 14:52869 (R;US)
Automated glass fiber drawing, 14:52661 (R;US)
Carbon monoxide rich methanation kinetics on supported rhodium and nickel catalysts, 14:52099 (R;US)
CMOS ASIC [application specific integrated circuit], 14:52956 (R;US)
Comparison of shock severity measures, 14:52872 (R;US)
Connector selection program user's guide: Version 1.0, 14:52868 (R;US)
Control of the variable speed generator on the Sandia 34-metre vertical axis wind turbine, 14:52133 (R;US)
Evaluation of shock isolation techniques for a piezoresistive accelerometer, 14:52870 (R;US)

Flame acceleration studies in the MINIFLAME facility, 14:52341 (R;US)
Geotechnology publications and related reports: A bibliography, January–December 1988, 14:53569 (R;US)
How good is the Acme Code, 14:54061 (R;US)
Issues pertinent to sealing of radioactive waste repositories in bedded salt formations, 14:51776 (R;US)
Location of interior impact source in randomly excited structures, 14:52873 (R;US)
Low cost simulator for strategic radiation environments, 14:52955 (R;US)
Membrane and durability studies for the zinc/bromine battery, 14:52370 (R;US)
Multi-megagauss magnetic field generation on Saturn, 14:52996 (R;US)
Near-threshold energy dependence of Xe-induced displacements on Ge(001), 14:53904 (R;US)
Network architecture functional description and design: Version 2.0, 14:54060 (R;US)
New field solver for the buckshot code, 14:52997 (R;US)
Projectile impact Hugoniot parameters for selected materials, 14:52577 (R;US)
Quasi-static and dynamic mechanical properties of a granite and a sandstone, 14:53574 (R;US)
Recirculating linear accelerator (RLA) injector and accelerating cavity improvements, 14:53036 (R;US)
Reference manual for the LIFE2 computer code, 14:52134 (R;US)
RLA [Recirculating Linear Accelerator] vertical turning field design, 14:53035 (R;US)
Sandia Satellite Program summary of operational procedures, 14:52471 (R;US)
Sodium/sulfur evaluation at SNL, 14:52369 (R;US)
Solar Industrial Process Heat Project: Final report, 14:52117 (R;US)
Stochastic electron beams in the ion-focussed regime, 14:53652 (R;US)
Surface roughening of Ge(001) during 200 eV Xe ion bombardment and Ge molecular beam epitaxy, 14:52576 (R;US)
Terrestrial nickel/hydrogen battery development at Johnson Controls, Inc., 14:52371 (R;US)
Test results and status of the DOE/Sandia 34-m VAWT Test Bed, 14:52135 (R;US)
The phase gradient autofocus algorithm: An optimal estimator of the phase derivative, 14:53115 (R;US)
The risk management implications of NUREG–1150 methods and results, 14:52337 (R;US)
Thermal environmental tests on space simulation chamber, 14:52867 (R;US)
VIBRAFUGE—Combined vibration and centrifuge testing, 14:52871 (R;US)
Zinc/bromine battery evaluation at SNL [Sandia National Laboratory], 14:52368 (R;US)

Sandia National Labs., Livermore, CA (USA)
Chemkin-II: A Fortran chemical kinetics package for the analysis of gas-phase chemical kinetics, 14:52833 (R;US)

Sao Paulo Univ., SP (Brazil). Inst. de Fisica
Influence of short range chemical order on density of states in α-ZrNi, 14:52544 (R;BR;In Portuguese)

Sao Paulo Univ., SP (Brazil). Inst. de Quimica
Addition compounds of lanthamide (III) and yttrium (III) hexafluorophosphates and N,N - dimethylformamide, 14:52729 (R;BR;In Portuguese)
Adducts compounds of lanthanides (III) trifluoreacetates and yttrium and the N,N - dimenthylformamide, 14:52719 (R;BR;In Portuguese)
Adducts of between lanthanide (III) trifluoromethanesulfonate and yttrium (III) and tetramethylene sulphoxide ligand, 14:52731 (R;BR;In Portuguese)
Electron transfer reactions in some complexes of V^{+2}, Co^{+3} and Eu^{+3}, 14:52727 (R;BR;In Portuguese)
Preparation and characterization of the adducts between lanthanide methanesulfonates and thioxane oxide, 14:52728 (R;BR;In Portuguese)
Structural study of pyrones by NMR, 14:52765 (R;BR;In Portuguese)
Study on effect of substituents in α positron of N,N-diethylamides by nuclear magnetic resonance, 14:53887 (R;BR;In Portuguese)
Substitution effect in nuclear magnetic resonance of C-13: α methoxicyclohexanones, 14:52764 (R;BR;In Portuguese)

Savannah River Lab., Aiken, SC (USA)
Compliance of the Savannah River Plant L-Reactor cooling system with environmental regulations: Demonstration in accordance with Section 316(a) of the Clean Water Act, November 1985–December 1987: Revision 1, 14:52276 (R;US)
PC-based calculation of activation energy using linear regression, 14:52857 (R;US)

Science Applications International Corp., Las Vegas, NV (USA)
Geology and hydrogeology of the proposed nuclear waste repository at Yucca Mountain, Nevada and the surrounding area, 14:51755 (R;US)

Science Applications International Corp., McLean, VA (USA)
Laboratory plasma studies. Final report, 14:53657 (R;US)

Shinetsu Chemical Industry Co. Ltd., Takefu, Fukui (Japan)
Fire propagation along cable bundles: influencing factors, testing methods and relevant state-of-the-art standards, 14:52156 (R;IT;In Italian)

Northeast Artificial Intelligence Consortium annual report, 1987. Volume 9. Computer architectures for very large knowledge bases. Interim report, December 1986-December 1987, 14:54036 (R;US)

Systems Control, Inc., Palo Alto, CA (USA)
Handbook for decision on industrial atmospheric-contaminant exposure levels. Final Field Handbook, 14:53158 (R;US)
Statistical theory for sampling of time-varying industrial atmosphere contaminant levels. Final report, 14:52491 (R;US)

T

Technische Hochschule Aachen (Germany, F.R.)
Development of a sinter/HIP cycle for the production of pure, dense Chromia and contributions to determine the diffusion coefficent of hydrogen through Cr_2O_3, 14:52619 (R;DE;In German)

Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst.
(eb), (et) type leptoquarks at ep colliders, 14:53708 (R;DE)
Measuring static quark properties at LEP, 14:53707 (R;DE)

Technische Univ. Hamburg-Harburg, Hamburg (Germany, F.R.)
Immobilazation of aerobic microorganisms on glassy sintered material, illustrated by the example of the production of L leucine using Corynebacterium glutamicum, 14:53289 (R;DE;In German)

TECOGEN, Inc., Waltham, MA (USA)
Desiccant-based, heat actuated cooling assessment for DHC systems: Quarterly report No. 1, May 1, 1989–July 31, 1989, 14:52502 (R;US)

TEM Associates, Inc., Berkeley, CA (USA)
Electric power from sugar cane in Costa Rica. A technical and economic analysis, 14:52422 (R;US)

Texas A and M Univ., College Station, TX (USA). Dept. of Physics
A microwave power driver for linac colliders: Gigatron, 14:53010 (R;US)
Recent developments of gigatron technology, 14:53009 (R;US)

Texas Tech Univ., Lubbock, TX (USA). Dept. of Chemistry and Biochemistry
Metal ion complexation by ionizable crown ethers: Progress report, September 1988–August 1989, 14:52763 (R;US)

Texas Univ., Austin, TX (USA)
Experimental investigation of driven Alfven-wave resonances on the PRETEXT tokamak, 14:53964 (D;US)
Experimental investigation of the dynamics of pellet ablation on the Texas Experimental Tokamak, 14:53967 (D;US)
Some aspects of plasma kinetic theory: Energetic particle physics; renormalization theory; anomalous electron transport in tokamaks, 14:53973 (D;US)
Systematic procedure for reservoir characterization: Final report, 14:51709 (R;US)

Texas Univ., Austin, TX (USA). Dept. of Chemistry
Photoinduced charge separation by polymer-bound chromophores: Progress report, September 1986–October 1989, 14:52837 (R;US)

Texas Univ., Austin, TX (USA). Dept. of Physics
Research in experimental nuclear physics: Progress report, April 1, 1987–March 31, 1990, 14:53749 (R;US)
Research in theoretical nuclear physics: Progress report, November 1, 1988–October 31, 1989, 14:53746 (R;US)

Texas Univ., Austin, TX (USA). Microelectronics Research Center
Single-filament effusion cell with reduced thermal gradient for molecular beam epitaxy, 14:52946 (R;US)

U

UKAEA Harwell Lab. (UK). Engineering Science Div.
Further LDA studies of liquid flow in a partially-blocked rod bundle, 14:52922 (R;GB)

UKAEA Harwell Lab. (UK). Materials Development Div.
Evolution of pH in a radwaste repository. Leaching of modified cements and reactions with groundwater, 14:51752 (R;GB)

UKAEA Harwell Lab. (UK). Nuclear Physics and Instrumentation Div.
Interlaboratory study of sampling and characterisation techniques for groundwater colloids, 14:53274 (R;GB)

Umweltbundesamt, Berlin (Germany, F.R.)
Investigation instigated to develop a reduction method for NO_x-emmission of oil and gas fired steam generators, 14:52961 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 45 t/h steam boiler fueled with heavy oil, 14:53188 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 25 t/h steam boiler fueled with heavy oil, 14:53189 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a circulating fluidized-bed system, 14:53192 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a brown-coal-fueled power plant boiler, 14:52154 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on an interlaboratory study on the precision of chemical methods of heavy metal and trace element analysis, 14:53196 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements, 14:53197 (R;DE;In German)

Underground Injection Practices Council, Oklahoma City, OK (USA)
The Louisiana Department of Natural Resources, Office of Conservation, Injection and Mining Division underground injection control program: A peer review, 14:53257 (R;US)

United Kingdom Nirex, Ltd., Harwell (UK)
Chemistry and expansion of limestone - Portland cement mortars exposed to sulphate containing solutions, 14:52659 (R;GB)
Long-term prediction of corrosion of stainless steel nuclear waste canisters, 14:52569 (R;GB)

United Nations, Geneva (Switzerland). Economic Commission for Europe
The coal situation in the ECE [Economic Commission for Europe] region in 1988 and global prospects for coal, 14:51705 (R;CH)

Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica
Characterization and sintering of ATR aluminia from niobium, 14:52545 (R;BR;In Portuguese)

Universidade Estadual de Campinas, SP (Brazil). Inst. de Quimica
Gallium determination with Rodamina B: a simple method, 14:52844 (R;BR;In Portuguese)

Universite de Technologie de Compiegne, 60 (France)
Cellulases of Trichoderma Reesei. Production and application, 14:52057 (R;FR;In French)

University of Southern California, Los Angeles, CA (USA)
Phase change in binary systems in porous media: Application to solution gas drive, 14:51716 (R;US)

University of Southern California, Los Angeles, CA (USA). Dept. of Electrical Engineering Electrophysics
Program of basic research for high-power switching and other high-power devices. Final report, 1 September 1985-28 February 1989, 14:52944 (R;US)

USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (USA). Federal Energy Management Program
FEMP Update: Federal Energy Management Activities, Summer 1989, 14:52409 (R;US)

USDOE Assistant Secretary for Environment, Safety and Health, Washington, DC (USA). Office of NEPA Project Assistance
Geothermal temperature gradient core drill, Santiam Pass, 14:52121 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA)
Environmental assessment for proposed energy conservation standards for two types of consumer products; refrigerators, refrigerator-freezers, and freezers; small gas furnaces; and a proposed "No standard" standard for television sets, 14:53284 (R;US)
Environmental assessment for proposed energy conservation standards for three types of consumer products: dishwashers, clothes washers and clothes dryers, 14:53285 (R;US)
Program appraisal of radiological protection at the Martin Marietta Energy Systems Oak Ridge complex, 14:52378 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (USA). Office of Environmental Analysis
A compendium of options for government policy to encourage private sector responses to potential climate change: Executive summary, 14:53150 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA)
Bioprocessing of coals workshop-III: Proceedings, 14:51621 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of Clean Coal Technology
Comprehensive report to Congress Clean Coal Technology Program: Innovative coke oven gas cleaning system for retrofit applications; A project proposed by Bethlehem Steel Corporation, 14:51622 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). Office of Planning and Environment
An analysis of markets for small-scale, advanced coal-combustion technology in Spain, Italy, and Turkey, 14:51696 (R;US)
Guide to federal export assistance activities applicable to the US coal and coal technologies industry, 14:51704 (R;US)

USDOE Assistant Secretary for Management and Administration, Washington, DC (USA). Office of Project and Facilities Management
Annual report on in-house energy management, FY 1988, 14:52410 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA)
Garrison-Taft 500 kV transmission project: Hunter survey, Phase 2: Final report, 14:52157 (R;US)
Garrison-Taft 500 kV transmission project: Hunter survey, Phase 3: Final report, 14:52158 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA). Div. of Fish and Wildlife
Minidoka Dam wildlife impact assessment: Final report, 1989, 14:52049 (R;US)

USDOE Bonneville Power Administration, Portland, OR (USA). Office of Engineering and Construction
Buffalo Flat service, 115-kV transmission project: Environmental assessment, 14:52148 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Coal, Nuclear, Electric and Alternate Fuels
Coal distribution, January–June 1989, 14:52414 (R;US)
Electric power monthly, July 1989, 14:52417 (R;US)
Estimation of US coal reserves by coal type: Heat and sulfur content, 14:51681 (R;US)
World nuclear fuel cycle requirements 1989, 14:51735 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Energy Markets and End Use
Monthly energy review, May 1989, 14:52420 (R;US)
State energy price and expenditure report 1987, 14:52421 (R;US)

USDOE Energy Information Administration, Washington, DC (USA). Office of Oil and Gas
Petroleum marketing annual 1988, 14:51722 (R;US)
Petroleum marketing monthly, July 1989, 14:51721 (R;US)
Petroleum marketing monthly, May 1989, 14:51720 (R;US)

USDOE Idaho Operations Office, Idaho Falls, ID (USA)
Bioprocessing of coals workshop-III: Proceedings, 14:51621 (R;US)

USDOE Morgantown Energy Technology Center, WV (USA)
Proceedings of the first annual fuel cells contractors review meeting, 14:52428 (R;US)
Proceedings of the fourteenth annual underground coal gasification symposium, 14:51625 (R;US)

USDOE Nevada Operations Office, Las Vegas, NV (USA)
Nevada test site low-level and mixed waste repository design in the unsaturated zone, 14:51754 (R;US)

USDOE Office of Energy Research, Washington, DC (USA). Office of Health and Environmental Research
Nomenclature for physical mapping of complex genomes, 14:53287 (R;US)

USDOE Richland Operations Office, WA (USA)
Draft remedial investigation/feasibility study work plan for the 300-FF-5 operable unit, Hanford Site, Richland, Washington, 14:51757 (R;US)
Remedial investigation/feasibility study work plan for the 1100-EM-1 operable unit, Hanford Site, Richland, Washington, 14:51861 (R;US)

USDOE Special Assignment Environmental Team, Washington, DC (USA)
Assessment of environmental conditions at the Rocky Flats Plant, Golden, Colorado, 14:53237 (R;US)

Utah Univ., Salt Lake City, UT (USA)
Coal surface control for advanced fine coal flotation: Quarterly report, April 1, 1989–June 30, 1989, 14:51619 (R;US)

V

Versar, Inc., Columbia, MD (USA)
Supplemental air-quality impact analysis for Easton Utilities Commission Power Plant, No. 2, Units 23 and 24, 14:52152 (R;US)

Versar, Inc., Springfield, VA (USA)
Commercial treatment/recovery TSDR (treatment, storage, disposal and recycling) survey data set, 14:52498 (R;US)

Vienna Univ. (Austria). Inst. fuer Theoretische Physik
Role of resonances in chiral perturbation theory, 14:53713 (R;AT)

Virginia Commonwealth Univ., Richmond, VA (USA)
[Compensation for peak shifts and variable background responses in fluorescence spectroscopy]: Second annual progress report, October 1, 1988–October 1, 1989, 14:52710 (R;US)

Virginia Polytechnic Inst., Blacksburg, VA (USA)
[Investigations in guage theories, topological solitons and string theories]: Progress report, 14:53727 (R;US)

Virginia Univ., Charlottesville, VA (USA). Dept. of Chemistry
Scheme for the direct analysis of organics in the environment by tandem mass spectrometry, 14:53267 (R;US)

Vrije Univ., Amsterdam (Netherlands). Subfaculteit Wiskunde en Informatica
Design and implementation of parallel MAKE, 14:54057 (R;NL)

W

Warren Spring Lab., Stevenage (UK)
Acid rain in the United Kingdom: Spatial distributions and seasonal variations in 1986. Report for January 1986-August 1988, 14:53165 (R;GB)
Assessment of particle and heavy-metal concentrations in the atmosphere around the Port Talbot works of the British Steel Corporation. Report for February-May 1987, 14:53162 (R;GB)

Assessment of particle and lead concentrations in the atmosphere around Associated Octel Ltd. at Ellesmere Port. Report for August 1986-January 1987, 14:53163 (R;GB)
Glass-contaminant removal from refuse-derived compost. Interim report. Report for April-July 1988, 14:52504 (R;GB)
Investigation of emissions from a chipboard production plant, 14:52492 (R;GB)
Investigation of pollutant emissions at sheffield municipal solid waste incinerator with assessment of long-term pollutant variability, 14:52505 (R;GB)
Investigation of two features of continuously released heavy gas plumes. Report for September 1986-December 1988, 14:53161 (R;GB)
Ozone monitoring in the UK (United Kingdom): A review of 1978/8. Data from monitoring sites operated by Warren Spring Laboratory, 14:53164 (R;GB)
Sampling and analysis of domestic refuse: A review of procedures at Warren Spring Laboratory. Report for January-August 1988, 14:52506 (R;GB)
UK (United Kingdom) emissions of air pollutants, 1970-1986, 14:53166 (R;GB)
Wind-tunnel measurements of the collection efficiency of two PM10 samplers: The Sierra-Andersen Model 321A hi-volume sampler and the EPA (Environmental Protection Agency) prototype dichotomous sampler. Report for August 1987-June 1988, 14:52964 (R;GB)

Washington Univ., Seattle, WA (USA). Dept. of Applied Mathematics
A tensor product b-spline method for 3D multi-block elliptic grid generation, 14:54040 (R;US)

Washington Univ., Seattle, WA (USA). Nuclear Physics Lab.
Status of and operating experience with the University of Washington superconducting booster linac, 14:52970 (R;US)

Washington Univ., St. Louis, MO (USA)
Separating the influx and efflux components of net uptake of NO_3^- and NH_4^+ with the use of isotopic fractional data: Final report, July 15, 1987–July 14, 1989, 14:53303 (R;US)

Western Kentucky Univ., Bowling Green, KY (USA). Center for Coal Science
Thermodynamics of the solvent swelling of coal: Technical progress report No. 4, June 1, 1989–August 31, 1989, 14:51665 (R;US)

Westinghouse Electric Corp., Pittsburgh, PA (USA). Science and Technology Center
Advanced research in solids transport: Rheological behavior of dense suspensions: Third quarterly report, April 1, 1989–June 30, 1989, 14:51685 (R;US)

Westinghouse Hanford Co., Richland, WA (USA)
A study of the hydrothermal stability of copper for use as a container material for nuclear waste, 14:52874 (R;US)
Application and results of a reinjection technique for hydrothermal experiments in Dickson autoclaves, 14:51783 (R;US)
Contamination control: A balance between containment design and good practice in operation, 14:53540 (R;US)
Corrosion of candidate container materials, 14:52579 (R;US)
Defense decontamination and decommissioning program, 14:51860 (R;US)
Draft liquid effluent study project plan: Revision 1, 14:51782 (R;US)
Effects of neutron irradiation to 63 dpa on the properties of various commercial copper alloys, 14:52542 (R;US)
Hanford Surplus Facilities Program plan: Fiscal year 1990, 14:51781 (R;US)
Introductory testimony: Hearing on nuclear power in space, 14:52210 (R;US)
Low temperature irradiations in FFTF [Fast Flux Test Facility], 14:52288 (R;US)
Tank farm surveillance and waste status summary report for July 1989, 14:51780 (R;US)
Transmission of low-magnitude seismic excitation into Hanford Site structures, 14:53573 (R;US)

Westinghouse Hanford Co., Shippingport, PA (USA). Shippingport Station Decommissioning Project Office
Shippingport Station Decommissioning Project: Activity specification 12: Decontamination topical report, 14:52296 (R;US)

Westinghouse Savannah River Co., Aiken, SC (USA)
An empirical computer model of the F-Area A-Line nitrogen oxides absorption column (F-8 Column), 14:52736 (R;US)
Application of Lotus 1-2-3 to heat transfer analysis: Revision 1, 14:52176 (R;US)
Applying hypertext to the construction of modular reactor operating procedures, 14:52256 (R;US)
Chlorine demand of Savannah River water, 14:51743 (R;US)
Comparison of unsaturated flow and transport models with volume and nitrate measurements from a pilot-scale, in-situ lysimeter with different geometry low level radioactive waste designs, 14:51759 (R;US)
Computer simulation of a nitrogen oxides absorption column at the Savannah River Site, 14:52875 (R;US)
Data acquisition system for monitoring nuclear waste vitrification, 14:51785 (R;US)
Defense Waste Processing Facility software implementation, 14:51786 (R;US)
Development of aqueous tritium effluent monitor, 14:52281 (R;US)
Helium-induced weld cracking in irradiated 304 stainless steel, 14:52539 (R;US)
Home range: A spatially continuous fractal approach, 14:53218 (R;US)
HyperCard development and implementation at SRS [Savannah River Site], 14:54065 (R;US)
Implementation of outline software for priority management, 14:54063 (R;US)
Integrated intelligent systems in advanced reactor control rooms, 14:52257 (R;US)
Large scale process simulation: A case study integrated waste processing flowsheet for SRS [Savannah River Site], 14:51784 (R;US)
Personal computer process data acquisition, 14:54064 (R;US)
Plant community structure in disturbed and undisturbed forested wetlands, 14:52289 (R;US)
Procurement of an optical disk information storage and retrieval system, 14:54077 (R;US)
Program for low-level radioactive waste disposal at the Savannah River Site, A U.S. nuclear materials production facility: Revision 1, 14:51758 (R;US)
Prototype axial power monitor performance, 14:52255 (R;US)
Selecting and effectively using a computer aided software engineering tool, 14:52876 (R;US)
Software for instrument control at the Savannah River site, 14:53119 (R;US)
Training Management Information System, 14:54076 (R;US)
Vitrification at the Savannah River Site, 14:51787 (R;US)

Wisconsin Univ., Madison, WI (USA)
Electron behavior during electron cyclotron resonance heating in the interchangeable-module stellarator, 14:53966 (D;US)
Heat-transfer measurements in a motored engine, 14:52510 (R;US)
Magnetic- and material-limiter discharges in Tokapole II, 14:53975 (D;US)
Ordered ceramic membranes: Annual progress report, May 1988–May 1989, 14:52476 (R;US)
Self-consistent bounce-averaged transport computations for stellarators, 14:53976 (D;US)
Test and evaluation of polymeric membranes for oxygen enrichment of air: Final report, 14:52477 (R;US)

Wisconsin Univ., Madison, WI (USA). Center for Climatic Research
Evaluation of climatic models: Comparison of simulated and observed patterns for past climates: Progress report, February 1, 1989–January 31, 1990, 14:53151 (R;US)

Woods Hole Oceanographic Institution, MA (USA)
Biogeochemistry of (210)Pb and (210)Po in fresh waters and sediments. Doctoral thesis, 14:53277 (R;US)
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)
Influence of geothermal sources on deep ocean temperature, salinity, and flow fields. Doctoral thesis, 14:52127 (R;US)
Marine geochemistry of methane. Doctoral thesis, 14:51731 (R;US)

Z

Ztek Corp., Waltham, MA (USA)
Planar solid oxide fuel cell development: Final report, 14:52429 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *EDB Subject Thesaurus* (DOE/OSTI-7000). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

Propagation of a premixed flame in a divided-chamber combustor, 14:52848 (J;US)
Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation, 14:53232 (R;IT;In Italian French English)
Test and evaluation of polymeric membranes for oxygen enrichment of air: Final report, 14:52477 (R;US)

AIR POLLUTION
See also INDOOR AIR POLLUTION
Evidence for cloud venting of mixed-layer ozone and aerosols, 14:53173 (R;US)
Micrometeorological investigation of surface exchange of trace gases: A case study. Technical memo, 14:53179 (R;US)
Stratospheric ozone depletion, 14:53178 (R;US)
Video images of smoke dispersion in the near wake of a model building. Part 1. Temporal and spatial scales of vortex shedding, 14:53172 (R;US)

Air Samplers
Statistical theory for sampling of time-varying industrial atmosphere contaminant levels. Final report, 14:52491 (R;US)

Atmospheric Chemistry
Study of the NO_3 radical decomposition reaction and the N_2O_5 in equilibrium with NO_3 + NO_2 equilibrium constant. Final report, 14:53181 (R;US)

Atmospheric Circulation
Investigation of two features of continuously released heavy gas plumes. Report for September 1986-December 1988, 14:53161 (R;GB)

Environmental Transport
Toxics-release inventory. Executive summary, 14:52380 (R;US)
Wind direction effects on dispersion from sources downwind of steep hills, 14:53171 (R;US)

Global Aspects
The role of halocarbons in stratospheric ozone depletion, 14:53143 (RA;US)

Health Hazards
Expedemiological studies on the influence of SO_2, NO_x and airborne dust concentrations on the incidence of in-patient children with stenosing laryngotracheitis in the Bochum city area, 14:53547 (R;DE;In German)

Manuals
Handbook for decision on industrial atmospheric-contaminant exposure levels. Final Field Handbook, 14:53158 (R;US)

Mathematical Models
Development and implementation of an up-to-date photochemical mechanism for use in airshed modeling. Appendices A-C. Summary report, 2 May 1986-2 May 1988 (Final), 14:53170 (R;US)
EPA (Environmental Protection Agency) Regional Oxidant Model (ROM2.0): Evaluation on 1980 NEROS data bases. Report for January 1987-April 1989, 14:53167 (R;US)
Performance of a Gaussian model for centerline concentrations in the wake of buildings, 14:53175 (R;US)
Suitability of diffusion and wind-field techniques for an emergency-response dispersion model. Technical memo, 14:53157 (R;US)
Supplemental air-quality impact analysis for Easton Utilities Commission Power Plant, No. 2, Units 23 and 24, 14:52152 (R;US)

Mutagens
Selection of a suitable extraction method for mutagenic activity from woodsmoke-impacted air particles, 14:53553 (R;US)

Regional Analysis
EPA (Environmental Protection Agency) Regional Oxidant Model (ROM2.0): Evaluation on 1980 NEROS data bases. Report for January 1987-April 1989, 14:53167 (R;US)

Remedial Action
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility, 14:53213 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report, 14:53215 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)

Research Programs
National Climate Program Five-Year Plan, 1989-1993, 14:53136 (R;US)

Respiratory System Diseases
Expedemiological studies on the influence of SO_2, NO_x and airborne dust concentrations on the incidence of in-patient children with stenosing laryngotracheitis in the Bochum city area, 14:53547 (R;DE;In German)
Synergistic effects of nitrogen dioxide and carbon dioxide following acute inhalation exposures in rats, 14:53554 (R;US)

Statistical Data
UK (United Kingdom) emissions of air pollutants, 1970-1986, 14:53166 (R;GB)

AIR POLLUTION CONTROL
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 1. Development of high reactivity sorbents. Final report, January 1986-December 1987, 14:51678 (R;US)
Modeling ambient carbon monoxide trends to evaluate mobile-source emissions reductions, 14:52522 (R;US)
Modeling ozone concentrations: Urban- and regional-scale models are needed to develop emission-control policies that reduce ozone levels, 14:53174 (R;US)

AIR POLLUTION MONITORS
Field evaluation of direct-reading continuous ethylene oxide monitors. Final report, 14:53137 (R;US)

AIR QUALITY
Modeling ozone concentrations: Urban- and regional-scale models are needed to develop emission-control policies that reduce ozone levels, 14:53174 (R;US)
Review of the national ambient air-quality standards for lead: exposure analysis methodology and validation. Staff report (Final), 14:53216 (R;US)
Supplemental air-quality impact analysis for Easton Utilities Commission Power Plant, No. 2, Units 23 and 24, 14:52152 (R;US)

AIR SAMPLERS
Statistical theory for sampling of time-varying industrial atmosphere contaminant levels. Final report, 14:52491 (R;US)

AIR TRANSPORT

LYMPHATIC SYSTEM

APPLICATORS (RADIOTHERAPY)
See RADIATION SOURCES

AQUATIC ECOSYSTEMS
Biological effects and environmental fate of antifouling substances. January 1978-July 1989 (Citations from the Life Sciences Collection data base). Report for January 1978-July 1989, 14:53555 (R;US)
Low levels of tritium and trace elements in autopsy tissue: Analytical methods, 14:53275 (R;IT;In Italian)
[The effects of ionizing radiation on terrestrial and freshwater organisms and ecosystems]: Foreign trip report, January 15–23, 1988, 14:53242 (R;US)

AQUIFERS
Aquifers: Ground-water treatment. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989, 14:53282 (R;US)
Comparison of methods to determine oxygen demand for bioremediation of a fuel-contaminated aquifer, 14:53266 (R;US)
National water summary 1986: Hydrologic events and groundwater quality. Annual report, 14:53211 (R;US)

ARCHAEOLOGY
Development and transfer of the early copper metallurgy, 14:53223 (RA;DE;In German)

ARCTIC OCEAN
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)

ARGON 38 TARGET
Spin and parity assignments to excited ^{37}Cl states, 14:53765 (RA;DE;In German)

ARGON IONS
Absorption at 248 nm in electron-beam pumped noble gases, 14:52916 (BA;US)

ARGON METHOD
See ISOTOPE DATING

ARMS CONTROL
Political and technical verification issues of limitations on sea-launched cruise missiles. Master's thesis, 14:52526 (R;US)
United States national strategy and defense policy objectives after chemical disarmament. Study project, 14:52525 (R;US)

AROMATIC COMPOUNDS
See AROMATICS

AROMATICS
See also ANILINE
BENZENE
PHENOLS
POLYCYCLIC AROMATIC HYDROCARBONS
QUINONES
Summary of data on individual organic contaminants in sediments collected during 1984, 1985, 1986, and 1987. Progress report, 14:53168 (R;US)

ARRAY PROCESSORS
Compiling high level constructs to distributed memory architectures. Final report, 14:54054 (R;US)
Design and implementation of parallel MAKE, 14:54057 (R;NL)
Designing arrays for modern high-resolution methods, 14:54066 (BA;US)
High performance parallel architectures, 14:54062 (R;US)
Improving the performance of parallel (and serial) reservoir simulators, 14:51711 (BA;US)
Multicast communication in multiprocessor systems, 14:54037 (R;US)
PASM parallel processing system: Design, simulation, and image-processing applications. Volume 1. Final report, 1 January 1986-31 December 1989, 14:54027 (R;US)
Video Analysis Transputer Array (VATA), 14:54028 (R;US)

ARSENIC
Distribution and mobilization of arsenic and antimony species in the Coeur d'Alene River system. Research report (Technical), 14:53264 (R;US)
Elastic screening of surface vibrations: Surface phonons on As:Si(111)(1 x 1), 14:52698 (J;US)
Neutron activation of selenium and arsenic with or without chemical separation, 14:53309 (J;US)

ARSENIC COMPOUNDS
Is YbAs a heavy Fermion system?, 14:53638 (R;US)
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)

ARSONIUM COMPOUNDS
See ARSENIC COMPOUNDS

ARTERIES
See also CORONARIES
Tactics of application of roentgenoendovascular dilatation during bilateral stenosing of kidney arteries, 14:53371 (RA;SU;In Russian)

ARTIFICIAL INTELLIGENCE
Advanced technology for nuclear powerplants, 14:52273 (BA;US)
An expert system for sensor data validation and malfunction detection, 14:52262 (BA;US)
An expert system for spare parts inventory control, 14:52271 (BA;US)
Applications of artificial intelligence in the U.S. nuclear industry, 14:52258 (BA;US)
Expert systems and command, control, and communication system acquisition. Master's thesis, 14:54032 (R;US)
Heuristic simulation of nuclear systems on a supercomputer using the HAL-1987 general-purpose production-rule analysis system, 14:52274 (BA;US)
INSPECTR, 14:54069 (BA;US)
Northeast Artificial Intelligence Consortium annual report, 1987. Volume 1. Executive summary. Interim report, December 1986-December 1987, 14:54034 (R;US)
Northeast Artificial Intelligence Consortium annual report, 1987. Volume 9. Computer architectures for very large knowledge bases. Interim report, December 1986-December 1987, 14:54036 (R;US)
Parallel vision algorithms. Annual technical report No. 2, 1 October 1987-28 December 1988, 14:54030 (R;US)

ASHES
See also FLY ASH
Development of a new type compound cement using coal ash, 14:51674 (R;JP;In Japanese)

ASPENS
Electrochemically assisted pyrolysis of hardwoods, 14:52043 (R;US)

ASPHALTS
Enhanced reactivity and selectivity in coal liquefaction and co-processing systems: Coal liquids modification for enhanced reactivity, 14:51634 (RA;US)

Material characterization of hot-mix recycled bituminous pavements. Executive Summary, 14:52495 (R;US)
Material characterization of hot-mix recycled bituminous pavements. Final report, 14:52494 (R;US)

ASSE SALT MINE
Radiation protection and environmental monitoring in the area of the Asse shaft plant. Annual report 1988, 14:51760 (R;DE;In German)

ASTROPHYSICS
A cosmic ray driven plasma instability, 14:53594 (RA;DE;In German)
Max-Planck-Institute for Nuclear Physics. Annual report 1988, 14:53751 (R;DE;In German)

ATF TORSATRON
Construction and initial operation of the Advanced Toroidal Facility, 14:54010 (R;US)

ATLANTIC OCEAN
See also CHESAPEAKE BAY
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)

ATMOSPHERIC CHEMISTRY
Development and implementation of an up-to-date photochemical mechanism for use in airshed modeling. Appendices A-C. Summary report, 2 May 1986-2 May 1988 (Final), 14:53170 (R;US)
High-temperature photochemistry kinetics studies of the reactions of H(1(2)s) and D(1(2)S) with N_2O, 14:52836 (R;US)
Study of the NO_3 radical decomposition reaction and the N_2O_5 in equilibrium with NO_3 + NO_2 equilibrium constant. Final report, 14:53181 (R;US)

ATMOSPHERIC EXPOSURE CHAMBERS
See EXPOSURE CHAMBERS

ATMOSPHERIC PRECIPITATIONS
Change of solar radiation energy and factors, 14:52052 (RA;JP;In Japanese)
Climate system research studies of global and regional instrumental data: Progress report for period December 1, 1988–November 30, 1989, 14:53152 (R;US)

ATOM-MOLECULE COLLISIONS
Spectroscopic studies of hydrogen atom and molecule collisions: Progress report, 14:53640 (R;US)
State-resolved cross sections for rotationally inelastic collisions of NH_2(x2B1 state) with helium, 14:53635 (R;US)

ATOMIC BEAMS
Working group written presentation: Atomic oxygen, 14:52567 (RA;US)

ATOMIC BOMBS

BACTERIAL DISEASES
See also TUBERCULOSIS
On pulmonary echinococcosis diagnosis, 14:53338 (RA;SU;In Russian)

BALLISTIC MISSILE DEFENSE
Design and optimization of hydrogen cooled pulsed storage inductors for electromagnetic launchers, 14:52363 (J;US)
EnviroNET: Space environment for Strategic Defense Initiative experiments, 14:54074 (RA;US)
Optimization of structures with passive damping and active controls. Final report, May-November 1988, 14:52853 (R;US)
SDS (strategic defense system) software testing and evaluation: A review of the state-of-the-art in software testing and evaluation with recommended R & D (research and development) tasks. Final report, 14:54078 (R;US)

BANKS
See COMMERCIAL BUILDINGS

BARIUM 138 TARGET
Properties of the giant dipole resonance built on the isobaric analog state, 14:53764 (J;US)

BARIUM 139
Nuclear data sheets for A=139, 14:53780 (J;US)

BARIUM COMPOUNDS
See also BARIUM OXIDES
Brief review of recent superconductivity research at NIST (National Institute of Standards and Technology). Bi-monthly report, 14:52625 (R;US)
Crystal chemistry, magnetic and electrical properties of La(2-x)Ba$_x$NiO$_4$, 14:52608 (R;US)

BARIUM OXIDES
Application of eV neutron scattering and eV neutron absorption techniques, 14:51959 (RA;US)
Correlation of thermally stimulated luminescence with radio frequency surface resistance of high-temperature superconductors, 14:52632 (J;US)
Flux pinning and microstructure in $YBa_2Cu_3O_7$, 14:52610 (R;US)
Influence of oxygen concentration on processing $YBa_2Cu_3O_{7-x}$, 14:52633 (J;US)
Ion beam analysis and modification of thin-film, high-temperature superconductors, 14:52621 (R;US)
Origin of the "linear" term in the specific heat of $YBa_2Cu_3O_7$, 14:52622 (R;US)
Static and dynamic magnetization properties of $Y_1Ba_2Cu_3O_z$ thin films, 14:52611 (R;US)
Study of high T_c superconducting thin films grown by MOCVD [metalorganic chemical vapor deposition]: Progress report, July 1, 1986–September 30, 1989, 14:52615 (R;US)
Surface resistance of $YBa_2Cu_3O_7$ films on $SrTiO_3$ and $LaGaO_3$ substrates, 14:52631 (J;US)
[Theoretical studies on high-temperature superconductivity]: Foreign trip report, August 29, 1987–August 20, 1988, 14:53916 (R;US)
[X-ray studies of strain, interface and impurity in semiconductors]: Technical progress report, July 1, 1988–June 30, 1989, 14:52645 (R;US)

BASALT
Application and results of a reinjection technique for hydrothermal experiments in Dickson autoclaves, 14:51783 (R;US)

BATTELLE PACIFIC NORTHWEST LABORATORIES
Plutonium assay of large waste burial containers at the Pacific Northwest Laboratory, 14:51903 (J;US)

BATTERIES (ELECTRIC)
See ELECTRIC BATTERIES

BEAM BENDING MAGNETS
RLA [Recirculating Linear Accelerator] vertical turning field design, 14:53035 (R;US)
Ring magnets for the synchrotron x-ray source at ANL, 14:52878 (BA;US)

BEAM BUNCHERS
Mechanical design and fabrication of a 425 MHz H^- buncher, 14:53045 (BA;US)

BEAM COOLING
Laser diagnostics and cooling of $^7Li^+$ and $^9Be^+$, 14:53031 (RA;DE;In German)

BEAM FOCUSING MAGNETS
Ring magnets for the synchrotron x-ray source at ANL, 14:52878 (BA;US)

BEAM MONITORS
Beam profile monitor by the method of rest gas ionisation, 14:53074 (RA;DE;In German)
Stepping motor adaptor actuator for a commercial uhv linear motion feedthrough, 14:53005 (R;US)

BEAM POSITION
Measuring axially varying beam position using *B*-dot monitors, 14:53096 (J;US)

BEAM TRANSPORT
MONO: A program to calculate synchrotron beamline monochromator throughputs, 14:52989 (R;US)

BEAM-PLASMA SYSTEMS
Effect of wave localization on plasma instabilities, 14:53970 (D;US)
Response times and energy partitioning in electron-beam-excited plasmas, 14:53980 (J;US)

BEAUTY MESONS
A beauty factory using an SRF linac and a storage ring, 14:52971 (R;US)

BEEF
See MEAT

BEES
[Collection of high quality acoustical records for honeybees]: Foreign trip report, January 24–February 1, 1987, 14:53226 (R;US)

BEHAVIOR
Lack of behavioral effects in the rhesus monkey: High peak microwave pulses at 1.3 GHz, 14:53565 (R;US)

BENZENE
A study of micellar-enhanced ultrafiltration: Progress report, March 1, 1989–February 28, 1990, 14:52709 (R;US)
Benzene emissions from coke by-product recovery plants, benzene storage vessels, equipment leaks, and ethylbenzene/styrene process vents: Background information and responses to technical comments for 1989 final decisions: Final EIS, 14:53212 (R;US)

BENZOFURANS
Interactive chemistry of coal-petroleum processing: Quarterly report, June 16–September 15, 1989, 14:51627 (R;US)

BER-2 REACTOR
Upgrading of the reactor BER II, 14:51973 (RA;US)

BERKELEY REACTOR
Radioactive inventory of a Berkeley heat exchanger, 14:52187 (R;GB)

BERLIN-2 RESEARCH REACTOR
See BER-2 REACTOR

BERYLLIA

BOLOMETERS
Cryogenic detectors: status and prospects, 14:53675 (R;FR)

BOLTZMANN-VLASOV EQUATION
Giant dipole modes in heavy-ion reactions, 14:53838 (R;FR)
Some aspects of plasma kinetic theory: Energetic particle physics; renormalization theory; anomalous electron transport in tokamaks, 14:53973 (D;US)

BONE DISEASES
See SKELETAL DISEASES

BONE MARROW
Transplantation of bone marrow in victims of the Chernobyl accident, 14:53433 (RA;XA)

BONE MARROW CELLS
Effect of tritiated water on human hemopoietic stem cells, 14:53510 (RA;JP)

BOOSTERS (PARTICLE)
See PARTICLE BOOSTERS

BOR-60 REACTOR
Recent experience measuring breeder fresh fuel assemblies, 14:51944 (J;US)

BORATES
Increase of thermal stability of rare earth orthoborates with chantite structure, 14:52802 (RA;SU;In Russian)
Kinetics of electrosynthesis of persalts on glassy carbon in solutions of carbonates, borates and nitrates, 14:52831 (RA;SU;In Russian)
Synthesis and investigation of monocrystals of rare earth scandoborates with chantite structure, 14:52797 (RA;SU;In Russian)

BOREHOLES
Issues pertinent to sealing of radioactive waste repositories in bedded salt formations, 14:51776 (R;US)

BORON
Development of a titanium/boron blending process, 14:53122 (R;US)
Explorations of mechanisms regulating ectomycorrhizal colonization of boron-fertilized pine: Quarterly report, July 1, 1989–September 30, 1989, 14:52055 (R;US)
Nuclear characterizations and applications of boron-containing materials, 14:52744 (J;US)

BORON CARBIDES
Reaction behaviour of B_4C absorber material with stainless steel and Zircaloy in severe LWR accidents, 14:52620 (R;DE)

BORON NITRIDES
Single-filament effusion cell with reduced thermal gradient for molecular beam epitaxy, 14:52946 (R;US)

BOTTOM MESONS
See BEAUTY MESONS

BOUNDARY LAYERS
See also PLASMA SCRAPE-OFF LAYER
Plasma behavior in the boundary layer near a railgun surface, 14:52981 (J;US)

Expert Systems
An expert system to estimate SNM production at LWR systems, 14:52167 (J;US)

Failed Element Detection
Benefits of routinely performing ultrasonic inspections for failures in irradiated fuel, 14:52168 (J;US)

Fuel Assemblies
Implementation of an advanced BWR design, 14:52171 (J;US)

Fuel Management
Benefits of barrier fuel on fuel cycle economics, 14:52170 (J;US)
Minimal cost reload method for boiling water reactors using the HUDDLE code, 14:52166 (J;US)

Fuel Rods
Criticality experiments with units of LWR-type fuel rods submerged in water and separated by neutron flux traps, 14:52175 (J;US)

Fuel-Cladding Interactions
Modeling and analysis of PCI in locally corroded BWR fuel, 14:52165 (J;US)

Meltdown
Reaction behaviour of B_4C absorber material with stainless steel and Zircaloy in severe LWR accidents, 14:52620 (R;DE)

Non-Proliferation Policy
An expert system to estimate SNM production at LWR systems, 14:52167 (J;US)

Pressure Vessels
Heavy-Section Steel Technology Program, 14:52164 (RA;US)

Primary Coolant Circuits
Demonstration of a prefilliming technique for primary piping in a Japanese BWR, 14:52173 (J;US)

Reactor Components
TEM [transmission electron microscopy], APFIM [atom-probe field ion microscopy], and SANS [small-angle neutron scattering] examination of aged duplex stainless steel components from some decommissioned reactors, 14:52172 (J;US)

Reactor Decommissioning
Evaluation of nuclear facility decommissioning projects (ENFDP) program, 14:52329 (RA;US)
Report on waste burial charges: Escalation of decommissioning waste disposal costs at low-level waste burial facilities: Revision 1, 14:52332 (R;US)

Reactor Operation
Licensee Event Report (LER) compilation for month of August 1989, 14:52230 (R;US)

Reactor Protection Systems
Resolution of Unresolved Safety Issue A-48, "Hydrogen control measures and effects of hydrogen burns on safety equipment", 14:52333 (R;US)

Reporting Requirements
Automating special nuclear materials tracking, 14:51943 (J;US)

Sabotage
Technical resolution of Generic Safety Issue A-29: Nuclear power plant design for reduction of vulnerability to industrial sabotage, 14:52331 (R;US)

Security
Technical resolution of Generic Safety Issue A-29: Nuclear power plant design for reduction of vulnerability to industrial sabotage, 14:52331 (R;US)

Spent Fuel Storage
Canisters for PCDP [Prototypical Consolidation Demonstration Program] consolidated fuel, 14:52169 (J;US)

CADMIUM
Distribution and mobilization of arsenic and antimony species in the Coeur d'Alene River system. Research report (Technical), 14:53264 (R;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal

and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Regularities of growth twin formation during zinc and cadmium monocrystal growing from melt. 4, 14:52547 (RA;SU;In Russian)
Silver-indium-cadmium control rod behavior in severe reactor accidents, 14:52356 (J;US)

CADMIUM CHLORIDES
On interference types in electrolyte solutions, 14:52819 (RA;SU;In Russian)
Structure and dynamics of particles in 1-1, 2-1, 3-1 electrolyte aqueous solutions, 14:52820 (RA;SU;In Russian)

CADMIUM COMPOUNDS
See also CADMIUM SELENIDES
CADMIUM SULFIDES
CADMIUM TELLURIDES
CADMIUM TUNGSTATES
Cadmium accelerates bone loss in ovariectomized mice and fetal rat limb bones in culture, 14:53416 (J;US)
Peculiarities of crystal formation of new double molybdates and tungstates, 14:52803 (RA;SU;In Russian)
Synthesis and properties of thionitrides $Me_4P_6N_{12}S$ (Me-Zn, Cd, Mg), 14:52830 (RA;SU;In Russian)

CADMIUM FLUORIDES
Calculation of impurity distribution coefficients from liquidus curves binary systems, 14:52773 (RA;SU;In Russian)
Multicomponent monocrystal fluoride materials (synthesis, structure, properties), 14:52775 (RA;SU;In Russian)

CADMIUM IODIDES
Growth of cadmium iodide crystals and their optical properties, 14:52786 (RA;SU;In Russian)

CADMIUM IONS
A study of micellar-enhanced ultrafiltration: Progress report, March 1, 1989–February 28, 1990, 14:52709 (R;US)

CADMIUM SELENIDES
Investigation of some properties of melts of compounds of A^2B^6 group, 14:52782 (RA;SU;In Russian)

CADMIUM SULFIDES
Growth of big alloyed monocrystals of cadmium thiogallate, 14:52776 (RA;SU;In Russian)
Investigation of some properties of melts of compounds of A^2B^6 group, 14:52782 (RA;SU;In Russian)
Preparation and some properties of monocrystals of solid solutions of $A^{2+}B^{6+}$ compounds, 14:52779 (RA;SU;In Russian)
Structure of CdS crystals grown from the melt, 14:52815 (RA;SU;In Russian)

CADMIUM TELLURIDES
Characterization of the α-SN/CDTE(110) interface by angle-resolved X-ray photoemission, 14:52666 (BA;US)
Explosive crystallization of amorphous substances (Substances: V, Yb, CdTe, indium antimonides.), 14:52769 (RA;SU;In Russian)
Growth processes, crystal structure and stability of properties of $Cd_xMn_yHg_{1-x-y}Te$ monocrystals ($0 \le x \le 0.4$; $0 \le y \le 0.2$), 14:52778 (RA;SU;In Russian)
Investigation of real structure of cadmium telluride crystals prepared by different methods, 14:52810 (RA;SU;In Russian)
Investigation of some properties of melts of compounds of A^2B^6 group, 14:52782 (RA;SU;In Russian)
Position-sensitive CdTe detector using improved crystal growth method. Final report, 14:53087 (R;US)
Preparation of ideal cadmium telluride crystals by oriented crystallization of melt, 14:52781 (RA;SU;In Russian)
Structure peculiarities of cadmium telluride monocrystals, 14:52814 (RA;SU;In Russian)
Study of high T_c superconducting thin films grown by MOCVD [metalorganic chemical vapor deposition]: Progress report, July 1, 1986–September 30, 1989, 14:52615 (R;US)
X-ray topographic study of real structure of cadmium telluride monocrytals, 14:52813 (RA;SU;In Russian)

CADMIUM TUNGSTATES
Optical heterogeneity, forming during $CdWO_4$ crystal growth, 14:52817 (RA;SU;In Russian)
Peculiarities of crystal growth process of complex oxide compounds (Cadmium tungstate.), 14:52791 (RA;SU;In Russian)

CALCIUM 40
Radiative muon capture in light nuclei, 14:53761 (R;CA)

CALCIUM 40 TARGET
Final-state interactions and relativistic effects in the quasielastic (*e,e'*) reaction, 14:53851 (J;US)

CALCIUM 45
Cadmium accelerates bone loss in ovariectomized mice and fetal rat limb bones in culture, 14:53416 (J;US)

CALCIUM FLUORIDES
Flashlamp-pumped performance of the solid state laser material $LiCaAlF_6:Cr^{3+}$, 14:52913 (BA;US)

CALCIUM IONS
Resonant dielectronic and direct excitation in crystal channels, 14:52686 (J;US)

CALCIUM ISOTOPES
See also CALCIUM 40
CALCIUM 45
Generalization of the sum rule for double Gamow-Teller operators, 14:53855 (J;US)

CALCIUM OXIDES
Correlation of thermally stimulated luminescence with radio frequency surface resistance of high-temperature superconductors, 14:52632 (J;US)
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 1. Development of high reactivity sorbents. Final report, January 1986-December 1987, 14:51678 (R;US)
Giant superconducting anisotropy in $Bi_2Sr_2Ca_1Cu_2O_{8+\delta}$, 14:52629 (J;US)
Influence of quenched defects on thermal expansion and glass transition in diopside ($CaMgSi_2O_6$), 14:52679 (BA;US)
Monocrystal growth of calcium-niobium-gallium garnets by pulling at a crystal seed from cold container, 14:52788 (RA;SU;In Russian)
Prospects for wavelength tunable lasers based on vacancy defects in alkaline-earth oxides, 14:52897 (R;US)
Steam gasification of carbon: Catalyst properties: Quarterly report, June 15, 1989–September 14, 1989, 14:51639 (R;US)

CALCIUM SULFATES
Thermoluminescent dosemeters of $CaSO_4$: Dy + Teflon, 14:53067 (R;BR)

CALCULATIONS (COMPUTER)
See COMPUTER CALCULATIONS

CALCULUS (DIFFERENTIAL)
See DIFFERENTIAL CALCULUS

CALIBRATION STANDARDS
IAEA research coordination meeting on X- and gamma-ray standards for detector efficiency calibration, Braunschweig, FRG, 31 May - 2 June 1989. Summary report, 14:53883 (R;XA)

CALIFORNIA
Development and implementation of an up-to-date photochemical mechanism for use in airshed modeling. Appendices A-C. Summary report, 2 May 1986-2 May 1988 (Final), 14:53170 (R;US)
Estimation of contemporary carbon in fine-particle aerosols from the 1987 SCAQS (Southern California Air Quality Study) program. Final report, 14:53180 (R;US)
Evaluation of nonpotable ground water in the desert area of southeastern California for powerplant cooling, 14:53281 (R;US)
Opportunities to protect instream flows and wetland uses of water in California, 14:52390 (R;US)
Siting a low-level waste facility in California: A success story, 14:51818 (J;US)
Time-resolved size distributions of sub-4 micrometers particle sulfur and nitrate. Final report, 14:53182 (R;US)

CALIFORNIUM 252
Comparison of evaluations of ^{252}Cf spontaneous shape fission prompt neutron spectrum, 14:53811 (RA;SU;In Russian)
Energy and angular distribution of neutron emission in the spontaneous fission of ^{252}Cf, 14:53804 (RA;SU)
Prompt neutron spectra of ^{233}U, ^{235}U, ^{239}Pu, ^{252}Cf fission in the energy range of 0.01-12 MeV, 14:53812 (RA;SU;In Russian)

CALORIMETERS

CERAMIC MELTERS
Data acquisition system for monitoring nuclear waste vitrification, 14:51785 (R;US)

CERAMICS
Applications of INAA with Ghent k_0 factors to the analysis of high-purity metals and ceramics, 14:52743 (J;US)
Evaluation of mechanical properties in reactor irradiated oxide ceramics and non-oxide ceramics, 14:52653 (R;JP;In Japanese)
Ion beam analysis and modification of thin-film, high-temperature superconductors, 14:52621 (R;US)
New structural materials. Final report, 14:52638 (R;US)
Nitrogen ceramics meeting in France, 14:52606 (R;US)
Outline of fuel/storage technology development, 14:52362 (RA;JP;In Japanese)
Processing of advanced ceramics using microwaves thermal treatments, 14:52617 (R;BR;In Portuguese)
Radiation damage microstructures in nuclear ceramics with applications in fusion energy technology and nuclear waste disposal: Final technical report, 14:52613 (R;US)
Solid lubrication studied by optical means. Final report, 1 March 1986-28 February 1989, 14:52933 (R;US)
The mechanical and tribological properties of ion implanted ceramics, 14:52626 (BA;US)
The role of mobile ions in fast ion conducting systems and high-impact strength ceramics: Progress report, August 1, 1987–March 1, 1988, 14:52614 (R;US)
Zirconia based ceramics, 14:52618 (R;BR;In Portuguese)
[Ion implantation of ceramics]: Foreign trip report, August 24–September 10, 1988, 14:53900 (R;US)

CERAMICS INDUSTRY
Once-firing of ceramic tiles. A demonstration at Adderley Green Tiles Ltd. [Bucknall], 14:52479 (R;GB)

CERIUM
Epitaxial film growth of single crystal Ce/V prepared by molecular-beam epitaxy, 14:52680 (BA;US)

CERIUM 139
Nuclear data sheets for A=139, 14:53780 (J;US)

CERIUM 142
Directional correlations of γ-transitions in ^{142}Ce, 14:53779 (R;BR)

CERIUM 143
Level structure of the odd mass Pr isotopes: Levels of $^{143}Pr_{84}$ populated in the beta decay of ^{143}Ce, 14:53781 (J;US)

CERIUM IONS
Anomalously small 4*f*-5*d* oscillator strengths and 4*f*-4*f* electronic Raman scattering cross sections for Ce^{3+} in crystals of $LuPO_4$, 14:52703 (J;US)
Intensities of electronic Raman scattering between crystal-field levels of Ce^{3+} in $LuPO_4$: Nonresonant and near-resonant excitation, 14:52702 (J;US)

CERIUM OXIDES
Crystal growth of cerium, praseodymium oxides and their solid solutions from melt, 14:52806 (RA;SU;In Russian)
Investigation of heterogeneity of phase and chemical composition of $Y_{3-x-y}Ce_xTb_yAl_5O_{12}$ crystals, 14:52816 (RA;SU;In Russian)

CERN II SYNCHROTRON
See CERN SPS SYNCHROTRON

CERN SPS SYNCHROTRON
CERES - an electron-pair spectrometer for proton-nucleus and nucleus-nucleus collisions at the CERN SPS, 14:53075 (RA;DE;In German)

CESIUM 137
CS-137 in Austrian domestic animals: determination of transfer parameters and meat contamination by live animal measurements, 14:53231 (R;AT)
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)

CESIUM 139
Nuclear data sheets for A=139, 14:53780 (J;US)

CESIUM CHLORIDES
Relaxation of surface properties of water and electrolyte aqueous solutions and water ionic equilibrium, 14:52821 (RA;SU;In Russian)
Structure and dynamics of particles in 1-1, 2-1, 3-1 electrolyte aqueous solutions, 14:52820 (RA;SU;In Russian)

CESIUM IODIDES
Plastic bending if CsI monocrystals pulled from melt at a crystal seed, 14:52809 (RA;SU;In Russian)

Preparation and investigation by the NQR method of monocrystals of $M_3{}^1Sb_2(Bi_2)Br_9(J_9)$ compounds, 14:52787 (RA;SU;In Russian)
Solvation enthalpies of nonpolar molecules and ions in individual solvents, 14:52827 (RA;SU;In Russian)

CHALK RIVER NUCLEAR LABS
RFQ1 fabrication and low power RF tuning, 14:53046 (BA;US)

CHANNELS (REACTOR)
See REACTOR CHANNELS

CHARGE STATE
Optimal control of photovoltaic systems by a new battery state-of-charge observer, 14:52105 (R;IT)

CHARGED-PARTICLE ACTIVATION
See ACTIVATION ANALYSIS

CHARGED-PARTICLE TRANSPORT
A finite-moments algorithm for transport equations in cylindrical geometry, 14:53874 (J;US)
A nodal method for time-dependent transport equations, 14:53871 (J;US)
Diffusion synthetic acceleration for S_n problems with reflecting boundaries, 14:53872 (J;US)
Self-consistent bounce-averaged transport computations for stellarators, 14:53976 (D;US)
Stability analysis of fine-mesh rebalance, 14:53875 (J;US)
Supercomputer S_N calculations without observable ray effects or numerical diffusion, 14:53873 (J;US)

CHARGING (REACTOR)
See REACTOR FUELING

CHARM PARTICLES
Tau Charm Factory physics, 14:53684 (R;US)

CHARMONIUM
See also J PSI-3097 MESONS
Tau Charm Factory physics, 14:53684 (R;US)

CHARS
A comparison of the combustibility of chars in fixed-bed and fluidised-bed reactors, 14:51700 (J;GB)
Population-balance model of physical transformations of ash during char oxidation, 14:51701 (J;US)
Steam gasification of carbon: Catalyst properties: Quarterly report, June 15, 1989–September 14, 1989, 14:51639 (R;US)

CHEMICAL ANALYSIS
See also ACTIVATION ANALYSIS
NONDESTRUCTIVE ANALYSIS
QUANTITATIVE CHEMICAL ANALYSIS
Chemical analysis of interplanetary dust particles using the proton-microprobe and synchrotron-radiation, 14:52734 (RA;DE;In German)
Implementation of an EPA [Environmental Protection Agency] compliance-related QA [quality assurance] program within the NQA-1 criteria, 14:52413 (R;US)

CHEMICAL EFFLUENTS
Biodenitrification of Hanford groundwater and process effluents: FY 1988 status report, 14:51772 (R;US)

CHEMICAL ENGINEERING
Adaptability in chemical engineering, 14:52373 (R;US)

CHEMICAL EXPLOSIVES
See also TATB
Critical temperature analysis for a hemispherical charge of a binary explosive, 14:53124 (R;US)
Remedial investigation of landfill Pit 8 Lawrence Livermore National Laboratory Site 300, 14:53229 (R;US)

CHEMICAL INDUSTRY
Waste heat recovery for use in distillation as identified by a process integration study. A demonstration at ICI plc. [Runcorn], 14:52485 (R;GB)

CHEMICAL LASERS
NS(B) (nitrogen sulfide (B state)) spectrum theory and code. Technical report, January-May 1989, 14:52896 (R;US)
Standard chemical oxygen-iodine laser kinetics package. Revision. Final report, August 1987-March 1988, 14:52891 (R;US)

CHEMICAL MUTAGENS
See MUTAGENS

CHEMICAL PROPERTIES
Compatibility coding of liquid hazardous waste, 14:51775 (R;US)
Physicochemical fundamentals of chemical technology. Issue 150. Proceedings of Institute, 14:52828 (R;SU)

CHEMICAL REACTIONS
See also HYDROGENATION
METHANATION
OZONIZATION
REFORMER PROCESSES
Chemkin-II: A Fortran chemical kinetics package for the analysis of gas-phase chemical kinetics, 14:52833 (R;US)

CHEMICAL REACTORS
Development of methanol-upgrading-type power-generation technology. Development of elemental technology, 14:52040 (RA;JP;In Japanese)
Enhanced reactivity and selectivity in coal liquefaction and co-processing systems: Coal liquids modification for enhanced reactivity, 14:51634 (RA;US)

CHEMICAL WARFARE AGENTS
United States national strategy and defense policy objectives after chemical disarmament. Study project, 14:52525 (R;US)

CHEMICAL WASTES
In situ vitrification of mixed wastes, 14:51800 (J;US)
Organic diagenesis in commercial nuclear wastes, 14:51832 (J;US)
Status of mixed-waste regulation, 14:51803 (J;US)
US ecology's efforts to obtain permission for mixed-waste disposal, 14:51801 (J;US)

CHEMISTRY
See also ATMOSPHERIC CHEMISTRY
NUCLEAR CHEMISTRY
RADIOCHEMISTRY
Physicochemical fundamentals of chemical technology. Issue 150. Proceedings of Institute, 14:52828 (R;SU)
Thirty-first ORNL/DOE conference on analytical chemistry in energy technology, 14:52708 (R;US)

CHEMOTHERAPY
Method for protecting bone marrow against chemotherapeutic drugs and radiation therapy using transforming growth factor beta 1, 14:53411 (P;US)

CHERNOBYLSK-4 REACTOR

Biological Effects
Preparation of an all-union distribution register of persons exposed to the effects of radiation as a result of the Chernobyl accident, with a view to evaluating exposure doses and making a long term public health forecast, 14:53438 (RA;XA)

Biological Radiation Effects
Problems of evaluating public health after an accident at a nuclear power plant, 14:53435 (RA;XA)

Biological Stress
Pseuchoneurotic disorders associated with the Chernobyl accident, 14:53286 (RA;XA)

Contamination
Radiological consequence of Chernobyl nuclear power accident in Japan. Review of radioecological studies and the dose assessment on Japanese for the period of 1 year after the accident, 14:52328 (R;JP;In Japanese)

Delayed Radiation Effects
Organization and planning of work involved in the long term clinical observation of children with a high radiation risk, 14:53439 (RA;XA)

Environmental Effects
Radioactive contamination of water ecosystems and sources of drinking water, 14:52308 (RA;XA)

Fallout
Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation, 14:53232 (R;IT;In Italian French English)

Iodine 131
Characteristics of radionuclide intake by inhalation, 14:52310 (RA;XA)

Mortality
Acute effects of radiation exposure following the Chernobyl accident: Immediate results of radiation sickness and outcome of treatment, 14:53432 (RA;XA)

Population Relocation
Medical demographic consequences of the Chernobyl accident, 14:52320 (RA;XA)

Radiation Accidents
Monitoring of internal exposure of the population in regions close to the Chernobyl nuclear power plant, 14:52317 (RA;XA)
Personnel protection during a reactor accident, 14:52313 (RA;XA)
Sanitary and health measures taken to deal with the consequences of the Chernobyl accident, 14:52304 (RA;XA)

Radiation Doses
Acute effects of radiation exposure following the Chernobyl accident: Immediate results of radiation sickness and outcome of treatment, 14:53432 (RA;XA)
Chernobyl experience in the context of contemporary radiation protection problems, 14:52305 (RA;XA)
Dynamics of gamma radiation levels and formation of external exposure dose, 14:52316 (RA;XA)
Long term prognosis of individual and collective exposure doses to the population, 14:52319 (RA;XA)
Methodological principles for calculating levels of external and internal exposure of the population used in taking strategic decisions, 14:52315 (RA;XA)
Methods for retrospective determination of absorbed doses in the human body resulting from external and internal exposure, 14:52318 (RA;XA)
Organizational, methodological and information aspects of the mass individual dosimetric surveys carried out in contaminated areas following the Chernobyl accident, 14:52321 (RA;XA)
Radiological consequence of Chernobyl nuclear power accident in Japan. Review of radioecological studies and the dose assessment on Japanese for the period of 1 year after the accident, 14:52328 (R;JP;In Japanese)

Radiation Effects
State of the pituitary and thyroid system in children at various times after exposure to radiation as a result of the Chernobyl accident, 14:53436 (RA;XA)

Radiation Injuries
Medical and sanitary measures taken to deal with the consequences of the Chernobyl accident, 14:52303 (RA;XA)
Rehabilitation of victims of acute radiation sickness, 14:53434 (RA;XA)
Transplantation of bone marrow in victims of the Chernobyl accident, 14:53433 (RA;XA)

Radiation Monitoring
Sanitary-dosimetric monitoring of food products, 14:52311 (RA;XA)

Radiation Protection
Database for a systems analytical approach to studying the medical aspects of the Chernobyl accident, 14:52322 (RA;XA)
Personnel protection during a reactor accident, 14:52313 (RA;XA)
Protective measures to reduce population exposure doses and effectiveness of these measures, 14:52314 (RA;XA)

Reactor Accidents
Aerial monitoring of terrestrial radioactive contamination due to Chernobyl incident, 14:53234 (RA;IT;In Italian)
Characteristics of radionuclide intake by inhalation, 14:52310 (RA;XA)
Methodological principles for calculating levels of external and internal exposure of the population used in taking strategic decisions, 14:52315 (RA;XA)
Nuclear criticality safety tools in the Chernobyl-4 accident analysis, 14:52361 (J;US)
Radiation monitoring of various objects as part of the Chernobyl accident management programme, 14:52312 (RA;XA)
Radiological consequence of Chernobyl nuclear power accident in Japan. Review of radioecological studies and the dose assessment on Japanese for the period of 1 year after the accident, 14:52328 (R;JP;In Japanese)
Sanitary-dosimetric monitoring of food products, 14:52311 (RA;XA)

Reactor Physics
Nuclear criticality safety tools in the Chernobyl-4 accident analysis, 14:52361 (J;US)

Remedial Action
Protection of health during a large scale accident, 14:52306 (RA;XA)
Sanitary and health measures taken to deal with the consequences of the Chernobyl accident, 14:52304 (RA;XA)

Surface Contamination
Radiation monitoring of various objects as part of the Chernobyl accident management programme, 14:52312 (RA;XA)

CHESAPEAKE BAY
Radionuclides and trace elements in middle Chesapeake Bay sediments, 14:51854 (J;US)

CHEST
Actual problems of roentgenodiapeutics in patients with thorax and abdomen cavities diseases, 14:53378 (RA;SU;In Russian)
Resolution of review roentgenography of chest organs in diagnosis of acute respiratory failure, 14:53348 (RA;SU;In Russian)
Roentgenological approach to differential diagnosis of cardialgias, 14:53361 (RA;SU;In Russian)

CHILDREN
Organization and planning of work involved in the long term clinical observation of children with a high radiation risk, 14:53439 (RA;XA)

CHINA
Energy and transport in China, 14:52408 (RA;US)

CHINSHAN-1 REACTOR
Modeling of GE generations 2 and 3 separators using the RETRAN-02/MOD3 separator model, 14:52174 (J;US)

CHINSHAN-2 REACTOR
Modeling of GE generations 2 and 3 separators using the RETRAN-02/MOD3 separator model, 14:52174 (J;US)

CHIRAL SYMMETRY
Role of resonances in chiral perturbation theory, 14:53713 (R;AT)

CHLOR-ALKALI INDUSTRY
See CHEMICAL INDUSTRY
CHLORINE

CHLORIDES
See also CADMIUM CHLORIDES
CESIUM CHLORIDES
POTASSIUM CHLORIDES
PRASEODYMIUM CHLORIDES
SODIUM CHLORIDES
STRONTIUM CHLORIDES
XENON CHLORIDES
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)

CHLORINATED AROMATIC HYDROCARBONS
Summary of data on individual organic contaminants in sediments collected during 1984, 1985, 1986, and 1987. Progress report, 14:53168 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report, 14:53215 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)

CHLORINE
Heterogeneous chemical processes in ozone depletion, 14:53144 (RA;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)

The chemical basis for removal of organic sulfur from coal via JPL (Jet Propulsion Laboratory) chlorinolysis, 14:51658 (J;US)

CHLORINE 37
Spin and parity assignments to excited ^{37}Cl states, 14:53765 (RA;DE;In German)

CHLORINE CHLORIDES
See CHLORINE

CHLORINE COMPOUNDS
See also CHLORIDES
Cyclic voltammetric study of organoactinide compounds of uranium(IV) and neptunium(IV). Ligand effects on the M(IV)/M(III) couple, 14:52847 (J;US)

CHONDRITES
Assemblage, composition, and possible thermal history of Fremdlinge in the Ca-Al-rich inclusion 477B from the Vigarano chondrite, 14:53591 (RA;DE;In German)
Investigations at the proton microprobe, 14:52733 (RA;DE;In German)

CHROMIUM
Characterization of Al and Al-Cr-Al thin films, 14:53654 (BA;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Spectroscopic and laser properties of Cr:LiCaA1F_6 and Cr:LiSrA1F_6 crystals, 14:52908 (R;US)

CHROMIUM 50 TARGET
Spin-flip transitions in ^{46}Ti, ^{48}Ti and ^{50}Cr excited by inelastic proton scattering, 14:53647 (R;FR)

CHROMIUM 52
Investigation of monoenergetic pair conversion, 14:53771 (RA;DE;In German)

CHROMIUM ALLOYS
See also ALLOY-MAR-M246
ALLOY-RA-333
CHROMIUM-NICKEL STEELS
HAYNES 188 ALLOY
NICKEL-CHROMIUM STEELS
Characterization of Al and Al-Cr-Al thin films, 14:53654 (BA;US)
Deformation and fracture of low alloy steels at high temperature: Final report, May 1, 1982–April 30, 1985, 14:51650 (R;US)
Development of a design methodology for high-temperature cyclic application of materials which experience cyclic softening, 14:51651 (R;US)
Elastic properties of superlattices, 14:52583 (BA;US)
Literature review of workability and phase stability relative to advanced austenitic alloys in steam service, 14:51652 (R;US)

CHROMIUM IONS
Atomic Data for Fusion: Volume 6, Spectroscopic data for titanium, chromium, and nickel: Volume 2: Chromium, 14:53955 (R;US)

CHROMIUM OXIDES
Development of a sinter/HIP cycle for the production of pure, dense Chromia and contributions to determine the diffusion coefficent of hydrogen through Cr_2O_3, 14:52619 (R;DE;In German)

CHROMIUM-NICKEL STEELS
Investigation of alloys for advanced steam cycle superheaters and reheaters, 14:52137 (RA;US)

CHROMODYNAMICS
See QUANTUM CHROMODYNAMICS

CHROMOSOMAL ABERRATIONS
Correlation of chromosome patterns in leukemic cells of patients with exposure to chemicals and/or radiation: Progress report, January 1, 1989–September 30, 1989, 14:53301 (R;US)

CHROMOSOME ABERRATIONS
See CHROMOSOMAL ABERRATIONS

CHROMOSOME EXCHANGES
See CHROMOSOMAL ABERRATIONS

CHROMOSOME FRAGMENTS

SUBBITUMINOUS COAL

Bioconversion
Bioprocessing of coals workshop-III: Proceedings, 14:51621 (R;US)

Biodegradation
Studies of the structure of biodegraded coal, 14:51668 (RA;US)

Burners
Evaluation of internally staged coal burners and sorbent-jet aerodynamics for combined SO_2/NOx control in utility boilers. Volume 1. Testing in a 10 million Btu/hr experimental furnace. Final report, October 1982-June 1985, 14:52153 (R;US)

Chemical Activation
Low severity conversion of activated coal: Quarterly report No. 5, September 1, 1988–November 30, 1988, 14:51626 (R;US)

Chemical Analysis
Basic process/resource evaluation task, 14:51664 (RA;US)

Combustion
An analysis of markets for small-scale, advanced coal-combustion technology in Spain, Italy, and Turkey, 14:51696 (R;US)
Determination of local radiative properties in coal-fired flames: Progress report, March 15, 1989–June 15, 1989, 14:51697 (R;US)
Kinetic modeling of artifacts in the measurement of N_2O from combustion sources, 14:52155 (J;US)

Coprocessing
Development of analytical procedures for coprocessing: Quarterly progress report, April 1–June 30, 1989, 14:51637 (R;US)
Enhanced reactivity and selectivity in coal liquefaction and co-processing systems: Coprocessing and coal liquefaction with novel catalysts, 14:51633 (RA;US)
Interactive chemistry of coal-petroleum processing: Quarterly report, June 16–September 15, 1989, 14:51627 (R;US)

Depolymerization
Integrated/characterization/modeling approach: Low temperature depolymerization and liquefaction of premium US coal samples, 14:51635 (RA;US)

Desulfurization
Coal desulfurization by bioprocessing, 14:51628 (RA;US)
Determination of sulfide in spent caustic solutions from the chemical cleaning of coal, 14:51656 (J;NL)
The chemical basis for removal of organic sulfur from coal via JPL (Jet Propulsion Laboratory) chlorinolysis, 14:51658 (J;US)

Distribution
Coal distribution, January–June 1989, 14:52414 (R;US)

Exports
Guide to federal export assistance activities applicable to the US coal and coal technologies industry, 14:51704 (R;US)

Flames
Reaction of nitric oxide with bound carbon at flame temperatures, 14:51702 (J;US)

Flotation
Coal surface control for advanced fine coal flotation: Quarterly report, April 1, 1989–June 30, 1989, 14:51619 (R;US)

Fluidized-Bed Combustion
Characterization and modification of particulate properties to enhance filtration performance: Quarterly technical progress report, June 1989–August 1989, 14:51676 (R;US)
[The status of advanced combustion for electric power generation from coal]: Foreign trip report, October 7, 1988–September 29, 1989, 14:52145 (R;US)

Fluidized-Bed Combustors
Scale-up of circulating fluidized bed coal combustors: Progress report, Fourth quarter, June 1, 1989–August 31, 1989, 14:51698 (R;US)

Global Aspects
The coal situation in the ECE [Economic Commission for Europe] region in 1988 and global prospects for coal, 14:51705 (R;CH)

In-Situ Gasification
Proceedings of the fourteenth annual underground coal gasification symposium, 14:51625 (R;US)

Market
An analysis of markets for small-scale, advanced coal-combustion technology in Spain, Italy, and Turkey, 14:51696 (R;US)
US clean coal technologies: International markets and competitive issues, 14:51703 (R;US)

Modifications
Coal surface control for advanced fine coal flotation: Quarterly report, April 1, 1989–June 30, 1989, 14:51619 (R;US)

Processing
Measurement and modeling of advanced coal conversion processes: 11th quarterly report, April 1, 1989–June 30, 1989, 14:51623 (R;US)

Pyrolysis
Integrated/characterization/modeling approach: Solvent extraction and ultrasonic extraction correlations to pyrolysis data, 14:51663 (RA;US)

Solvent Extraction
Integrated/characterization/modeling approach: Solvent extraction and ultrasonic extraction correlations to pyrolysis data, 14:51663 (RA;US)

Structural Chemical Analysis
Project integration and database development, 14:51636 (RA;US)

Supply and Demand
Promotive study on preparation of basis for foreign coal import. Study on coal renaissance, 14:51706 (RA;JP;In Japanese)

Surface Properties
Coal surface control for advanced fine coal flotation: Quarterly report, April 1, 1989–June 30, 1989, 14:51619 (R;US)
Fundamental research on surface science of coal in support of physical beneficiation of coal: Quarterly technical progress report No. 7, April 1–June 30, 1989, 14:51659 (R;US)
Materials characterization study of coal liquefaction processes, 14:51629 (RA;US)
Surface properties of coal and their role in coal beneficiation: Technical progress report, June 15–September 14, 1989, 14:51667 (R;US)

Swelling
Thermodynamics of the solvent swelling of coal: Technical progress report No. 4, June 1, 1989–August 31, 1989, 14:51665 (R;US)

Transport
Studies of dense phase cohesive coal transport in plugs: Quarterly report, July–September 1989, 14:51694 (R;US)

COAL DEPOSITS

Basic research for the development of coal resources, 14:51684 (RA;JP;In Japanese)
Prospecting in Ensham project, 14:51683 (RA;JP;In Japanese)
Rotary-drilling techniques used in the Beckley Coalbed. Report of Investigations/1989, 14:51686 (R;US)

COAL EXTRACTS
Studies of the structure of biodegraded coal, 14:51668 (RA;US)
Thermodynamics of the solvent swelling of coal: Technical progress report No. 4, June 1, 1989–August 31, 1989, 14:51665 (R;US)

COAL FINES
Electrostatic agglomeration apparatus with multipole electrodes (Part 1). Presentation of the apparatus and its preliminary experiment, 14:51695 (R;JP;In Japanese)

COAL GASIFICATION
A model for cavity growth and resource recovery during underground coal gasification, 14:51655 (J;US)
A new method for estimation of activation energies associated with coal gasification, 14:51657 (J;US)
Development of hydrogen production technology. Utilizing coal research and development of material for gasifier, 14:51649 (RA;JP;In Japanese)
Outline of development of coal liquefaction and gasification, 14:51644 (RA;JP;In Japanese)
Steam conditioning of coal for synfuels production: Fifth quarterly report, January 1–March 31, 1988, 14:51624 (R;US)
Steam gasification of carbon: Catalyst properties: Quarterly report, June 15, 1989–September 14, 1989, 14:51639 (R;US)

COAL GASIFICATION PLANTS
Characterization of MGP (manufactured gas plant) residues using proposed RCRA (Resource Conservation Recovery Act) tests. Topical report, May 1987-February 1989. Final report, 14:51653 (R;US)
Development of low calorific gasification power generation technology (fluidized bed), 14:51645 (RA;JP;In Japanese)
Fuel-use options for the management of MGP (manufactured gas plant) site wastes. Topical report, June-December 1987, 14:51654 (R;US)

COAL INDUSTRY
Guide to federal export assistance activities applicable to the US coal and coal technologies industry, 14:51704 (R;US)
Survey of government assistance for the world's hard-coal industries, 14:51707 (R;US)

COAL LIQUEFACTION
Basic process/resource evaluation task, 14:51664 (RA;US)
Coprocessing of coal with heavy oil and petroleum residuals, 14:51630 (RA;US)
Development of bituminous coal liquefaction technology. Progress of research and development by 1 t/d PSU, 14:51647 (RA;JP;In Japanese)
Enhanced reactivity and selectivity in coal liquefaction and coprocessing systems: Coprocessing and coal liquefaction with novel catalysts, 14:51633 (RA;US)
Enhanced reactivity and selectivity in coal liquefaction and coprocessing systems: Cyclic olefins: New hydrogen donors for coal liquefaction, 14:51632 (RA;US)
Integrated/characterization/modeling approach: Fourier transform IR and chromatographic studies in coal liquefaction chemistry, 14:51662 (RA;US)
Integrated/characterization/modeling approach: Low temperature depolymerization and liquefaction of premium US coal samples, 14:51635 (RA;US)
Integrated/characterization/modeling approach: Solvent extraction and ultrasonic extraction correlations to pyrolysis data, 14:51663 (RA;US)
Liquefaction research in pyrolysis, catalysis and coal dissolution, 14:51631 (RA;US)
Low severity conversion of activated coal: Quarterly report No. 5, September 1, 1988–November 30, 1988, 14:51626 (R;US)
Outline of development of coal liquefaction and gasification, 14:51644 (RA;JP;In Japanese)
Project integration and database development, 14:51636 (RA;US)
Two-stage, close coupled catalytic liquefaction of coal: Third quarterly report, 1 April 1989–30 June 1989, 14:51638 (R;US)

COAL LIQUEFACTION PLANTS
Technological development of brown coal liquefaction. Current status of Australian brown coal project, 14:51646 (RA;JP;In Japanese)

COAL LIQUIDS
Development of common basic technology. Development of coal liquid upgrading and oil mixing technologies, 14:51648 (RA;JP;In Japanese)
Enhanced reactivity and selectivity in coal liquefaction and coprocessing systems: Coal liquids modification for enhanced reactivity, 14:51634 (RA;US)
Integrated/characterization/modeling approach: Coal structure/liquefaction yield correlation by means of advanced NMR techniques, 14:51660 (RA;US)
Integrated/characterization/modeling approach: Fourier transform IR and chromatographic studies in coal liquefaction chemistry, 14:51662 (RA;US)
Integrated/characterization/modeling approach: Low temperature depolymerization and liquefaction of premium US coal samples, 14:51635 (RA;US)
Integrated/characterization/modeling approach: Mass spectrometric investigation of coal pyrolysis mechanisms and kinetics, 14:51661 (RA;US)
Integrated/characterization/modeling approach: Solvent extraction and ultrasonic extraction correlations to pyrolysis data, 14:51663 (RA;US)

COAL MINERS
Reducing miner absenteeism. Information Circular/1989, 14:51691 (R;US)

COAL MINES
Control of diesel exhaust emissions in underground coal mines: Fuel modifications. Open file report, September 1978-December 1988 (Final), 14:51692 (R;US)

COAL MINING
Capillary wetting response of coal after exposure to ambient air atmosphere. Report of Investigations/1989, 14:51688 (R;US)
Comparative study of blasting vibrations from Indiana surface coal mines. Report of Investigations/1989, 14:51690 (R;US)
Evaluation of high-pressure front-mounted water jets for frictional-ignition suppression. Report of Investigations/1989, 14:51687 (R;US)
Reducing miner absenteeism. Information Circular/1989, 14:51691 (R;US)
Respirable dust generation: Comparison of continuous and conventional mining methods when excavating rock in coal mines. Report of Investigations/1989, 14:51689 (R;US)
Rotary-drilling techniques used in the Beckley Coalbed. Report of Investigations/1989, 14:51686 (R;US)

COAL PRODUCING DISTRICTS
Demand for energy in the Illinois coal market, 14:52419 (R;US)

COAL RESERVES
Estimation of US coal reserves by coal type: Heat and sulfur content, 14:51681 (R;US)
Outline of coal resources development, 14:51682 (RA;JP;In Japanese)

COAL SEAMS
A model for cavity growth and resource recovery during underground coal gasification, 14:51655 (J;US)

COAL-DERIVED LIQUIDS
See COAL LIQUIDS

COAL-FIRED GAS TURBINES
Potential applications of structural ceramic composites in gas turbines: Final report, 14:52146 (R;US)

COAL-OIL MIXTURES
See COAL
FUEL OILS

COASTAL REGIONS
Summary of data on individual organic contaminants in sediments collected during 1984, 1985, 1986, and 1987. Progress report, 14:53168 (R;US)
Summary of selected data on chemical contaminants in sediments collected during 1984, 1985, 1986, and 1987. Technical memo, 14:53176 (R;US)

COATED FUEL PARTICLES
MHTGR fuel design and quality, 14:52201 (J;US)
Research and development of HTGR fuels, 14:52189 (R;JP;In Japanese)

COATINGS
See also PROTECTIVE COATINGS
SPRAYED COATINGS
Nontoxic foul-release coatings: Final report, 14:52141 (R;US)
Polyacrylic acid-modified zinc phosphate conversion coatings for corrosion protection of steel, 14:52640 (R;US)

COBALT
Electron transfer reactions in some complexes of V^{+2}, Co^{+3} and Eu^{+3}, 14:52727 (R;BR;In Portuguese)

COBALT 59
Investigation of monoenergetic pair conversion, 14:53771 (RA;DE;In German)

COBALT 59 TARGET
Properties of the giant dipole resonance built on the isobaric analog state, 14:53764 (J;US)

COBALT ALLOYS
See also ALLOY-MAR-M246
ALLOY-RA-333
X-ray-optical multilayer structures studied using high resolution electron microscopy, 14:52585 (BA;US)

COBALT COMPOUNDS
Coprocessing of coal with heavy oil and petroleum residuals, 14:51630 (RA;US)
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)

COHERENT RADIATION
Coherent 70.9-nm radiation generated in neon by frequency tripling the fifth harmonic of a Nd:YAG laser, 14:52894 (R;US)

COILS (MAGNETIC)
See MAGNET COILS

COINCIDENCE METHODS
A method for picosecond lifetime measurements for neutron-rich nuclei. Pt. 1. Outline of the method, 14:53092 (J;NL)

COKE OVENS
Comprehensive report to Congress Clean Coal Technology Program: Innovative coke oven gas cleaning system for retrofit applications; A project proposed by Bethlehem Steel Corporation, 14:51622 (R;US)
COLD CATHODE TUBES
Program of basic research for high-power switching and other high-power devices. Final report, 1 September 1985-28 February 1989, 14:52944 (R;US)
COLD PLASMA
Static and dynamic properties of confined, cold ion plasmas: MD [molecular dynamics] simulations, 14:53052 (R;US)
Two-dimensional plasma-electron temperature measurements, 14:53984 (J;US)
COLLECTIVE MODEL
Adiabatic time-dependent Hartree-Fock theory in the generalized valley approximation, 14:53856 (J;US)
Coexistence of collectivity and chaos in nuclei, 14:53832 (RA;DE;In German)
COLLIERIES
See COAL MINES
COLLIMATORS
Designing means and specifications for model FT-619 kidney function instrument, 14:53063 (R;CN;In Chinese)
COLLISIONAL PLASMA
Magnetic reconnection simulation using the 2.5 D electromagnetic direct implicit code AVANTI, 14:53934 (RA;FR)
Neoclassical transport induced by ICRF [ion-cyclotron range of frequencies] in the collisional regime, 14:53937 (R;US)
COLLISIONLESS PLASMA
Ion collection by probing objects in flowing magnetized plasmas, 14:53932 (R;US)
Kinetic simulation of magnetic reconnection in the presence of shear, 14:53935 (RA;FR)
Some aspects of plasma kinetic theory: Energetic particle physics; renormalization theory; anomalous electron transport in tokamaks, 14:53973 (D;US)
COLLOIDS
See also FOAMS
Interlaboratory study of sampling and characterisation techniques for groundwater colloids, 14:53274 (R;GB)
COLON
See LARGE INTESTINE
COLOR MODEL
Does string fragmentation reveal more than longitudinal phase space?, 14:53702 (RA;DE)
J/psi suppression, 14:53703 (RA;DE)
Nanti N-annihilation in the large N_c-limit, 14:53700 (RA;DE)
COLUMBIUM
See NIOBIUM
COLUMNS (EXTRACTION)
See EXTRACTION COLUMNS
COLUMNS (MECHANICAL)
See MECHANICAL STRUCTURES
COMBINED GAS AND STEAM CYCLE POWER PLANTS
See COMBINED-CYCLE POWER PLANTS
COMBINED-CYCLE POWER PLANTS
Development of low calorific gasification power generation technology (fluidized bed), 14:51645 (RA;JP;In Japanese)
Proceedings: Fourth symposium on integrated environmental control, 14:51677 (R;US)
COMBUSTION CHAMBERS
Development of hydrogen production technology. Utilizing coal research and development of material for gasifier, 14:51649 (RA;JP;In Japanese)
COMBUSTION PRODUCTS
Contribution of wood smoke and motor-vehicle emissions to ambient aerosol mutagenicity, 14:53551 (R;US)
Mechanisms of interaction of radiation with matter: Progress report, September 1, 1988–August 31, 1989, 14:53430 (R;US)
Quality-assurance procedures: Method 5G determination of particulate emissions from wood heaters from a dilution tunnel sampling location, 14:52457 (R;US)
Selection of a suitable extraction method for mutagenic activity from woodsmoke-impacted air particles, 14:53553 (R;US)
COMBUSTORS
See also FLUIDIZED-BED COMBUSTORS
Development of methanol-upgrading-type power-generation technology. Development of elemental technology, 14:52040 (RA;JP;In Japanese)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements, 14:53197 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on an interlaboratory study on the precision of chemical methods of heavy metal and trace element analysis, 14:53196 (R;DE;In German)
Propagation of a premixed flame in a divided-chamber combustor, 14:52848 (J;US)
COMETS
See also HALLEY COMET
CoMA, an experiment for the detailed in-situ analysis of collected cometary particulates, 14:53079 (RA;DE;In German)
COMMERCIAL BUILDINGS
Indoor air pollution: Health effects. January 1970-July 1989 (Citations from the COMPENDEX data base). Report for January 1970-July 1989, 14:53186 (R;US)
COMMON MARKET
ENEL Tavazzano-Montanaso (Italy) fossil-fuel power plant: report on environmental compatibility, 14:52150 (R;IT;In Italian)
The development of trend and pattern analysis methods for incident data by CEC's Joint Research Centre at Ispra (Italy), 14:52291 (R;IT)
COMMUNICATIONS
Architecturally-focused benchmarks with a communication example, 14:54058 (R;US)
Emerging high-frequency (HF) and related radio-communications concepts for enduring C(3)I roles in a nuclear war environment: Critical issues in nuclear weapons effects on propagation. Topical report, 5 January-1 June 1980, 14:53129 (R;US)
Expert systems and command, control, and communication system acquisition. Master's thesis, 14:54032 (R;US)
Multicast communication in multiprocessor systems, 14:54037 (R;US)
Nuclear-survivable C(3) system design. Technical report, 14:53130 (R;US)
SDS (strategic defense system) software testing and evaluation: A review of the state-of-the-art in software testing and evaluation with recommended R & D (research and development) tasks. Final report, 14:54078 (R;US)
COMPACT IGNITION TOKAMAK
LN_2 cyclic cooling considerations of fusion ignition devices, 14:54024 (J;US)
Remote maintenance of Compact Ignition Tokamak ex-vessel systems, 14:53989 (R;US)
COMPATIBILITY (IMMUNOLOGICAL)
See IMMUNITY
COMPLEMENT
Human genes for complement components C1r and C1s in a close tail-to-tail arrangement, 14:53298 (J;US)
COMPLEX TERRAIN
Suitability of diffusion and wind-field techniques for an emergency-response dispersion model. Technical memo, 14:53157 (R;US)
Wind direction effects on dispersion from sources downwind of steep hills, 14:53171 (R;US)
COMPLEXES
See also KRYPTON COMPLEXES
XENON COMPLEXES
Poly(ethylene oxide) complexed with KI: An x-ray absorption study, 14:52642 (R;US)
COMPOSITE MATERIALS
Characteristics of liquid-phase-sintered tungsten heavy alloys, 14:52532 (R;US)

Isothermal life prediction of composite lamina using a damage mechanics approach, 14:52658 (R;US)
New structural materials. Final report, 14:52638 (R;US)

COMPOST
Glass-contaminant removal from refuse-derived compost. Interim report. Report for April-July 1988, 14:52504 (R;GB)

COMPOUND NUCLEI
Thermal and statistical properties of nuclei and nuclear systems, 14:53841 (R;US)

COMPOUND-NUCLEUS REACTIONS
Sensitivity of compound-nucleus observables to time-reversal non-invariance, 14:53828 (RA;DE)

COMPOUNDS (ORGANIC)
See ORGANIC COMPOUNDS

COMPRESSORS
Axial-flow compressors. January 1970-July 1989 (Citations from the COMPENDEX database). Report for January 1970-July 1989, 14:52866 (R;US)

COMPTON SCATTERING TOMOGRAPHY
Compton scatter tomography and its inversion using a few projections, 14:52930 (J;US)

COMPUTED TOMOGRAPHY
See COMPUTERIZED TOMOGRAPHY

COMPUTER ARCHITECTURE
Architecturally-focused benchmarks with a communication example, 14:54058 (R;US)
Fault-tolerant computer architecture modeling and analysis. Final technical report, August 1985-August 1988, 14:54033 (R;US)
Northeast Artificial Intelligence Consortium annual report, 1987. Volume 9. Computer architectures for very large knowledge bases. Interim report, December 1986-December 1987, 14:54036 (R;US)
PASM parallel processing system: Design, simulation, and image-processing applications. Volume 1. Final report, 1 January 1986-31 December 1989, 14:54027 (R;US)
Parallel vision algorithms. Annual technical report No. 2, 1 October 1987-28 December 1988, 14:54030 (R;US)
Risk assessment and LAVA's [Los Alamos Vulnerability and Risk Assessment] dynamic threat analysis, 14:54049 (R;US)
SDS (strategic defense system) software testing and evaluation: A review of the state-of-the-art in software testing and evaluation with recommended R & D (research and development) tasks. Final report, 14:54078 (R;US)
Software tools for controlling, distributing, and installing software at Los Alamos National Laboratory, 14:54051 (R;US)

COMPUTER CALCULATIONS
A company perspective on software engineering standards, 14:52239 (J;US)
ANS-10 standards - current status and future direction, 14:54070 (J;US)
Achieving quality in engineering computer applications, 14:52880 (J;US)
IEEE [Institute of Electrical and Electronics Engineers] standards and nuclear software quality engineering, 14:52237 (J;US)
NRC [Nuclear Regulatory Commission] perspective of software QA [quality assurance] in the nuclear history, 14:52240 (J;US)
The impact of changing computing technology on EPRI [Electric Power Research Institute] nuclear analysis codes, 14:52238 (J;US)

COMPUTER CODES
See also E CODES
R CODES
Calculations and measurements for the SLAC SLC positron return quadrupole magnet, 14:53000 (BA;US)
Liquid Metal Thermal Electric Converter, 14:52426 (BA;US)
STEM - software test and evaluation methods: fault detection using static analysis techniques, 14:52247 (R;GB)
Self-consistent bounce-averaged transport computations for stellarators, 14:53976 (D;US)

COMPUTER GRAPHICS
GRASYS: a computer program of graph synthesis system. User's manual, 14:54046 (R;JP;In Japanese)
Parallel vision algorithms. Annual technical report No. 2, 1 October 1987-28 December 1988, 14:54030 (R;US)

COMPUTER NETWORKS
Computer group, 14:54043 (RA;DE;In German)
ESnet/DECnet security policy, procedures and guidelines, 14:54041 (R;US)
Expert systems and command, control, and communication system acquisition. Master's thesis, 14:54032 (R;US)
Network architecture functional description and design: Version 2.0, 14:54060 (R;US)

COMPUTER PROGRAMMING
See PROGRAMMING

COMPUTER PROGRAMS

COPPER SELENIDES
CUPRATES
Brief review of recent superconductivity research at NIST (National Institute of Standards and Technology). Bi-monthly report, 14:52625 (R;US)
Observation of a far-infrared sphere resonance in superconducting La(2-x)Sr(x)CuO(4-y) particles, 14:52607 (R;US)
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)
Sequence specificity of DNA cleavage by Bis(1,10-phenanthroline)copper(I): Effects of single base pair transitions on the cleavage of preferred pyrimidine-purine-pyrimidine triplets, 14:53297 (J;US)

COPPER IONS
A study of micellar-enhanced ultrafiltration: Progress report, March 1, 1989–February 28, 1990, 14:52709 (R;US)

COPPER OXIDES
Application of eV neutron scattering and eV neutron absorption techniques, 14:51959 (RA;US)
Correlation of thermally stimulated luminescence with radio frequency surface resistance of high-temperature superconductors, 14:52632 (J;US)
Flux pinning and microstructure in $YBa_2Cu_3O_7$, 14:52610 (R;US)
Giant superconducting anisotropy in $Bi_2Sr_2Ca_1Cu_2O_{8+\delta}$, 14:52629 (J;US)
Influence of oxygen concentration on processing $YBa_2Cu_3O_{7-x}$, 14:52633 (J;US)
Ion beam analysis and modification of thin-film, high-temperature superconductors, 14:52621 (R;US)
Origin of the "linear" term in the specific heat of $YBa_2Cu_3O_7$, 14:52622 (R;US)
Static and dynamic magnetization properties of $Y_1Ba_2Cu_3O_z$ thin films, 14:52611 (R;US)
Study of high T_c superconducting thin films grown by MOCVD [metalorganic chemical vapor deposition]: Progress report, July 1, 1986–September 30, 1989, 14:52615 (R;US)

Surface resistance of $YBa_2Cu_3O_7$ films on $SrTiO_3$ and $LaGaO_3$ substrates, 14:52631 (J;US)
[Theoretical studies on high-temperature superconductivity]: Foreign trip report, August 29, 1987–August 20, 1988, 14:53916 (R;US)
[X-ray studies of strain, interface and impurity in semiconductors]: Technical progress report, July 1, 1988–June 30, 1989, 14:52645 (R;US)

COPPER SELENIDE SOLAR CELLS
Development of tandem cells consisting of GaAs single crystal and CuInSe2/CdZnS polycrystalline thin films, 14:52076 (RA;US)
Directions for further development of GaAs/CuInSe2 thin film tandem cells, 14:52077 (RA;US)

COPPER SELENIDES
Composition and substrate effects on the structure of thin-film $CuGaSe_2$, 14:52630 (J;US)

COPPER VAPOR LASERS
See GAS LASERS

CORE BARREL
See CORING EQUIPMENT

CORES (REACTOR)
See REACTOR CORES

CORING EQUIPMENT
The design and use of an electrically driven core sampler capable of obtaining marine sediment cores through dense substrates, 14:53571 (R;US)

CORIUM
Interfacial instabilities leading to bubble departure during film boiling on vertical surface, 14:52342 (BA;US)

CORNEA
Biomedical studies with the free-electron laser. Final report, 1 February 1986-31 January 1988, 14:53561 (R;US)

CORONA (SOLAR)
See SOLAR CORONA

CORONARIES
Roentgenoangiographic indices in evaluation of the state of coronary channel therminal area, 14:53380 (RA;SU;In Russian)

CORROSION PRODUCTS
Laser Raman Spectroscopy in studies of corrosion and electrocatalysis, 14:52536 (R;US)

COSMIC ELECTRONS
Direct electron-pair production by high energy heavy charged particles. Final report, April 15, 1988-15 October 1989, 14:53606 (R;US)
Global kinetic theory of astrophysical jets, 14:53586 (RA;FR)

COSMIC GAMMA BURSTS
Neutron starquakes and the nature of gamma-ray bursts, 14:53584 (RA;FR)

COSMIC GAMMA SOURCES
A new model of PeV gamma-ray sources, 14:53583 (RA;FR)

COSMIC NUCLEI
Computer simulations of cosmic-ray diffusion near supernova remnant shock waves, 14:53576 (RA;FR)

COSMIC PARTICLES
See COSMIC RADIATION

COSMIC PROTONS
A new model of PeV gamma-ray sources, 14:53583 (RA;FR)

COSMIC RADIATION
See also COSMIC ELECTRONS
COSMIC NUCLEI
COSMIC PROTONS
PRIMARY COSMIC RADIATION
Laboratory simulation of cosmic-ray-induced upset in microelectronics, 14:53103 (J;US)
Neutron radioactivation spectroscopy of residual silver in nuclear emulsions exposed to cosmic radiation. Experiment: EXOBLOC 2 COSMOS 1887, 14:53064 (R;FR;In French)
Position-sensitive CdTe detector using improved crystal growth method. Final report, 14:53087 (R;US)
Shock-associated plasma density fluctuations in the interstellar medium, 14:53581 (RA;FR)
[Terrestrial space radiation and its effects]: Foreign trip report, October 10–25, 1987, 14:53612 (R;US)

COSMIC SHOWERS
Rapid fitting of particle cascade development data from X-ray film densitometry measurements, 14:53610 (R;US)

COSMOGONY
See COSMOLOGY

COSMOLOGY
Evolution of cosmic string networks, 14:53616 (J;US)
Fermions in an Aharonov-Bohm field and cosmic strings, 14:53618 (J;US)

COSMOS
See UNIVERSE

COST ESTIMATION
Automated Estimating System (AES): Version 3.1, User's manual: Revision 3, 14:54048 (R;US)

COSTA RICA
Electric power from sugar cane in Costa Rica. A technical and economic analysis, 14:52422 (R;US)

COUNTING CIRCUITS
Nuclear physics electronics, 14:53072 (RA;DE;In German)

COUNTING TECHNIQUES
See also COINCIDENCE METHODS
RADIOISOTOPE SCANNING
Set-up of a hyperon beam experiment at the CERN Omega Spectrometer, 14:53076 (RA;DE;In German)

COUPLED CHANNEL THEORY
Observable effects of poles and shadow poles in coupled-channel systems, 14:53854 (J;US)

CP INVARIANCE
Comments on a definition of maximal CP violation, 14:53717 (R;CN)
Present status of CP violation, 14:53711 (R;CA)

CRANKING MODEL
The adiabatic cranking model for large amplitudes, 14:53837 (RA;DE)

CRAY COMPUTERS
An efficient UNICOS run-time system for functional programs on a CRAY X-MP, 14:54052 (R;US)

CRITICALITY
A computerized control system for critical facilities at Los Alamos National Laboratory, 14:52887 (J;US)
An improved Dancoff correction factor for the SCALE code system, 14:52246 (J;US)
Instrumentation for criticality safety control in a fuel fabrication facility, 14:51875 (J;US)
Plant protection system to assure criticality safety in uranium extraction, 14:52890 (J;US)
Qualification of KENO calculations with ENDF/B-V cross sections, 14:52882 (J;US)
Remote radiation monitoring in critical experiments, 14:52888 (J;US)
The elimination of ray tracing in Monte Carlo shielding programs, 14:52881 (J;US)
Validation of the YAEC [Yankee Atomic Electric Company] criticality safety methodology, 14:52884 (J;US)
Validation studies performed with mixed Pu + U aqueous critical experiments in annual geometry, 14:51873 (J;US)

CRITICALITY ACCIDENTS
See CRITICALITY
RADIATION ACCIDENTS

CRUCIBLES
Single-filament effusion cell with reduced thermal gradient for molecular beam epitaxy, 14:52946 (R;US)

CRUDE OIL
See PETROLEUM

CRUISE MISSILES
Political and technical verification issues of limitations on sea-launched cruise missiles. Master's thesis, 14:52526 (R;US)

CRYOGENIC BUBBLE CHAMBERS
Cryogenic detectors: status and prospects, 14:53675 (R;FR)

CRYOGENICS
Use of the TACL [Thaumaturgic Automated Control Logic] system at CEBAF [Continuous Electron Beam Accelerator Facility] for control of the Cryogenic Test Facility, 14:53019 (R;US)

CRYOPUMPS
Space shuttle main engine high pressure fuel turbopump turbine blade cracking, 14:52864 (R;US)
CRYSTAL DEFECTS
Electron microdiffraction and channeling: Theory and applications, 14:53907 (D;US)
CRYSTAL GROWTH
Crystal growth from melts. V. 3. Extended theses, 14:52530 (R;SU;In Russian)
Numerical modeling of concentration fields in melt during growth of monocrystals of complex oxide compounds with a wide region of homogeneity (gadolinium-gallium garnet as an example), 14:52770 (RA;SU;In Russian)
CRYSTAL LATTICES
Electron microdiffraction and channeling: Theory and applications, 14:53907 (D;US)
New approach to the thermodynamics of condensed matter. Part 1. The specific heat, at constant pressure, of metals, 14:52540 (R;IT)
CRYSTALS
See also LIQUID CRYSTALS
REFLECT: A computer program for the x-ray reflectivity of bent perfect crystals, 14:53107 (R;US)
CULTURES (CELLS)
See CELL CULTURES
CUMULATIVE EFFECT
See PARTICLE PRODUCTION
CUPRATES
Brief review of recent superconductivity research at NIST (National Institute of Standards and Technology). Bi-monthly report, 14:52625 (R;US)
Electrochemical formation of polypyrrole films on $YBa_2Cu_3O_{7-x}$. Technical report, 14:52604 (R;US)
High-temperature superconductivity research in selected laboratories in West Germany. Technical report, 14:52605 (R;US)
Observation of a far-infrared sphere resonance in superconducting La(2-x)Sr(x)CuO(4-y) particles, 14:52607 (R;US)
CURIUM 245 TARGET
Measurement of transuranium element fission cross section on spectrometer of delayed neutrons in lead, 14:53801 (RA;SU;In Russian)
CURRENT-DRIVE HEATING
Radiofrequency plasma heating and current drive, 14:53939 (R;DE)
CUTTING TOOLS
Use of single-cutter data in the analysis of PDC bit designs, 14:52129 (J;US)
CYANOBACTERIA
Characterization of the cytochrome c oxidase in isolated and purified plasma membranes from the cyanobacterium Anacystis nidulans, 14:53296 (J;US)
Site-directed mutagenesis in photosystem II of the cyanobacterium Synechocystis sp. PCC 6803: Donor D is a tryosine residue in the D2 protein, 14:52104 (J;US)
CYCLOALKANES
Cyclic voltammetric study of organoactinide compounds of uranium(IV) and neptunium(IV). Ligand effects on the M(IV)/M(III) couple, 14:52847 (J;US)
CYCLOALKENES
Enhanced reactivity and selectivity in coal liquefaction and coprocessing systems: Cyclic olefins: New hydrogen donors for coal liquefaction, 14:51632 (RA;US)
CYTOCHROME OXIDASE
Characterization of the cytochrome c oxidase in isolated and purified plasma membranes from the cyanobacterium Anacystis nidulans, 14:53296 (J;US)

D

D MESONS
Study of Ds decays, 14:53682 (R;US)
D PLUS RESONANCES
See D MESONS
D-1865 RESONANCES
See D MESONS
D-T REACTORS
Summary of recent results form the JAERI/US fusion neutronics phase 1 experiments, 14:54021 (J;US)
DAMS
Minidoka Dam wildlife impact assessment: Final report, 1989, 14:52049 (R;US)
DARK MATTER
See NONLUMINOUS MATTER
DATA ACQUISITION
Supervisory control and data acquisition (SCADA). January 1977-July 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities database). Report for January 1977-July 1989, 14:54075 (R;US)
DATA ACQUISITION SYSTEMS
Development of a VAX-VMS multiparameter data acquisition system, 14:54044 (RA;DE;In German)
Electronics for online computers and data acquisition, 14:54042 (RA;DE;In German)
Floating data acquisition system for microwave calorimeter measurements on MTX, 14:54013 (R;US)
DATA COMPILATION
Database for a systems analytical approach to studying the medical aspects of the Chernobyl accident, 14:52322 (RA;XA)
DATA PROCESSING
See also DISTRIBUTED DATA PROCESSING
On the determination of track parameters with the forward drift chambers of the ZEUS detector, 14:53062 (R;DE;In German)
DATA STORAGE DEVICES
See MEMORY DEVICES
DATA-FLOW PROCESSING
Efficient lazy data structures on a data-flow machine. Technical report, 14:54029 (R;US)
DAUGHTER PRODUCTS
Evaluation of radon emissions and potential control requirements: For the Weldon Spring Site Remedial Action Project, Weldon Spring, Missouri: Revision 1, 14:51859 (R;US)
DEBRIS (NUCLEAR)
See FISSION PRODUCTS
DECAY AMPLITUDES
Non-leptonic decay of T-mesons, 14:53693 (R;CN)
DECAY PRODUCTS
See DAUGHTER PRODUCTS
DECOMMISSIONING

F

F REGION
Ionospheric variability. Final report, October 1985-October 1988, 14:53621 (R;US)

F1-1420 MESONS
Current status of E/f_1(1420) and ι/η(1450), 14:53670 (R;US)

FABRIC FILTERS
Characterization and modification of particulate properties to enhance filtration performance: Quarterly technical progress report, June 1989–August 1989, 14:51676 (R;US)

FACE CENTERED CUBIC
See FCC LATTICES

FACILITIES (ENERGY)
See ENERGY FACILITIES

FACILITIES (MILITARY)
See MILITARY FACILITIES

FACILITIES (NUCLEAR)
See NUCLEAR FACILITIES

FAILED ELEMENT DETECTION
Use of rod internal pressure sensor and cladding extensometer as failure detection monitors during reactivity initiated accident conditions, 14:52163 (R;JP;In Japanese)

FALLOUT
See also FALLOUT DEPOSITS
Aerial monitoring of terrestrial radioactive contamination due to Chernobyl incident, 14:53234 (RA;IT;In Italian)

FALLOUT DEPOSITS
Basis of measures (radiation protection) adopted by Italy following the Chernobyl accident, 14:53236 (RA;IT;In Italian)
Radioecological consequences of Chernobyl: Review of radiation monitoring - civil defense activities in Italy, 14:53235 (RA;IT;In Italian)
Report of the consultants' meeting on "fallout radioactivity monitoring in environment and food" (MEF), French Nuclear Research Centre, Cadarache, France, 15-17 July 1987, 14:53421 (R;XA)

FALLOUT PARTICULATES
See FALLOUT
PARTICLES

FAR ULTRAVIOLET RADIATION
Coherent 70.9-nm radiation generated in neon by frequency tripling the fifth harmonic of a Nd:YAG laser, 14:52894 (R;US)

FARM ANIMALS
See DOMESTIC ANIMALS

FAST BREEDER TYPE REACTORS
See FBR TYPE REACTORS

FAST FLUX TEST FACILITY REACTOR
See FFTF REACTOR

FAST REACTORS
See also ACTINIDE BURNER REACTORS
FBR TYPE REACTORS
FFTF REACTOR
Modifications to HFEF/S for IFR fuel cycle demonstration, 14:52207 (J;US)
Progress in the development of metallic fuel in fast reactors, 14:52205 (J;US)
Update on development of the IFR pyroprocess, 14:52206 (J;US)

FAST-MIXED SPECTRUM REACTOR
See FBR TYPE REACTORS

FASTBUS SYSTEM
Performance of the Lep Time Digitizer (LTD), 14:53053 (R;FR)

FASTENERS
Cracking of 1-inch UF_6 cylinder valve packing nuts: The effects of packing nut torque on stem seal leakage and packing nut stress due to thermal expansion of the PTFE stem seal rings, 14:52550 (R;US)

FAULT TOLERANT COMPUTERS
Fault-tolerant computer architecture modeling and analysis. Final technical report, August 1985-August 1988, 14:54033 (R;US)

FAULT TREE ANALYSIS
System reliability, 14:51876 (R;US)

FAULT TREE SYSTEMS
See FAULT TREE ANALYSIS

FBR TYPE REACTORS
See also DFR REACTOR
LMFBR TYPE REACTORS
Electrochemical uranium valence control in centrifugal solvent extraction contactors, 14:51745 (J;US)

FCC LATTICES
Lattice-dynamical calculation of the Kapitza resistance between fcc lattices, 14:53912 (J;US)
FEDAL
See FAILED ELEMENT DETECTION
FEDERAL BUILDINGS
Evaluation of radon emissions and potential control requirements: For the Weldon Spring Site Remedial Action Project, Weldon Spring, Missouri: Revision 1, 14:51859 (R;US)
FEDERAL DRIVING CYCLE
See FEDERAL TEST PROCEDURE
FEDERAL REGION I
See also MASSACHUSETTS
New England seismotectonic study activities during fiscal year 1980, 14:53570 (R;US)
FEDERAL REPUBLIC OF GERMANY
Characterization program for the Gorleben site in Germany, 14:51826 (J;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements, 14:53197 (R;DE;In German)
FEDERAL TEST PROCEDURE
Durability testing of a Toyota LCS-M (lean combustion system-methanol) Carina. Technical report, 14:52523 (R;US)
Light-duty automotive technology and fuel-economy trends through 1989. Technical report, 14:52512 (R;US)
FEDERATION OF MALAYA
See MALAYSIA
FELDSPARS
Optically stimulated luminescence (OSL), 14:52648 (RA;DE;In German)
FERMENTATION
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency bioreactor, 14:52035 (RA;JP;In Japanese)
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency module, 14:52033 (RA;JP;In Japanese)
FERMILAB ACCELERATOR
Combining multipole data, 14:53044 (BA;US)
Installation and operation of a new extraction area in the FNAL Booster, 14:52980 (BA;US)
FERMILAB TEVATRON
400-MeV upgrade for the Fermilab linac, 14:52972 (R;US)
FERMIONS
See also LEPTONS
QUARKS
Fermions in an Aharonov-Bohm field and cosmic strings, 14:53618 (J;US)
Is YbAs a heavy Fermion system?, 14:53638 (R;US)
FERMIUM 258
Spontaneous fission properties of ^{258}Fm, ^{259}Md, ^{260}Md, ^{258}No, and ^{260}[104]: Bimodal fission, 14:53820 (J;US)
FERRATES
Studies of hypervalent iron, 14:52759 (R;US)
FERRIC COMPOUNDS
See IRON COMPOUNDS
FERRITE GARNETS
Investigation of heterogeneity of phase and chemical composition of $Y_{3-x-y}Ce_xTb_yAl_5O_{12}$ crystals, 14:52816 (RA;SU;In Russian)
FERROCENE
Langmuir-Blodgett films of a pyrrole and ferrocene mixed surfactant system, 14:52641 (R;US)
FERROUS COMPOUNDS
See IRON COMPOUNDS
FESHBACH-PORTER-WEISSKOPF MODEL
See OPTICAL MODELS
FFTF REACTOR
Low temperature irradiations in FFTF [Fast Flux Test Facility], 14:52288 (R;US)
Smart sensor application to nuclear plant thermocouple channels, 14:52261 (BA;US)
FIBER OPTICS
Fiber optic pressure measurement during an electromagnetic pulse, 14:54016 (BA;US)
Interlaboratory comparison of radiation-induced attenuation in optical fibers: Part 3, Transient exposures, 14:52662 (R;US)
FIBERS
See also CARBON FIBERS
OPTICAL FIBERS
Automated glass fiber drawing, 14:52661 (R;US)
FIBROSIS
Delayed radiation intrapelvic fibrosis, 14:53449 (RA;SU;In Russian)
FIELD EFFECT TRANSISTORS
Epitaxial GaAs on SOI wafers. Final report, 1 August 1988-31 January 1989, 14:52636 (R;US)
FIELD THEORIES
See also QUANTUM FIELD THEORY
Topics in gauge theories and the unification of elementary particle interactions: Progress report, April 1, 1988–February 28, 1989, 14:53728 (R;US)
FIELDS (ELECTRIC)
See ELECTRIC FIELDS
FIELDS (ELECTROMAGNETIC)
See ELECTROMAGNETIC FIELDS
FIELDS (GRAVITATIONAL)
See GRAVITATIONAL FIELDS
FIELDS (MAGNETIC)
See MAGNETIC FIELDS
FILM BOILING
Two-dimensional analytical model of inverted-annular film boiling, 14:52924 (R;CN;In Chinese)
FINLAND
Rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, 14:52717 (RA;XA)
FIREDAMP
See METHANE
FISHES
Evaluation of candidate measures of biological effects for the National Status and Trends Program. Technical memo. February 1987-April 1989 (Final), 14:53265 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North Atlantic): Rainbow smelt, 14:53250 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Summer and winter flounder, 14:53254 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North and Mid-Atlantic): Tautog and cunner, 14:53249 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Atlantic menhaden, 14:53251 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Mid-Atlantic): Weakfish, 14:53252 (R;US)
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (south Florida): Black, red, and Nassau groupers, 14:53253 (R;US)
FISSILE MATERIALS
Assay of fissile materials using a combined thermal/epithermal neutron interrogation technique, 14:51924 (J;US)
In situ measurements of neutron multiplying systems, 14:51742 (R;US)
The ^{252}Cf noise analysis method for in-plant criticality safety, 14:52889 (J;US)
FISSION
See also PHOTOFISSION
SPONTANEOUS FISSION
THERMAL FISSION
Calculation of β-delayed processes, 14:53824 (RA;DE;In German)
Fission yield in odd nuclei fission by neutrons, 14:53810 (RA;SU;In Russian)

Proceedings of the international conference on nuclear fission: Fifty years of progress in energy security, 14:52407 (J;US)
The analyses of neutron coincidence data to verify both spontaneous-fission and fissionable isotopes, 14:51877 (R;US)

FISSION ISOMERS
Design and test of an electrostatic deflector for fission isomers, 14:53027 (RA;DE;In German)

FISSION NEUTRONS
See also DELAYED NEUTRONS
Dose-response modeling of life shortening in a retrospective analysis of the combined data from the JANUS program at Argonne National Laboratory, 14:53541 (J;US)

FISSION PRODUCTS
A method for picosecond lifetime measurements for neutron-rich nuclei. Pt. 1. Outline of the method, 14:53092 (J;NL)

FISSIONABLE MATERIALS
See also FISSILE MATERIALS
System reliability, 14:51876 (R;US)

FISSIONABLE MATERIALS MANAGEMENT
See NUCLEAR MATERIALS MANAGEMENT

FISSURED FORMATIONS
See FRACTURED RESERVOIRS

FISTULAE
Treatment of rectovaginal fistulae following radiation treatment of uterine and cervix uteri carcinoma, 14:53461 (RA;SU;In Russian)

FLAMES
Flame acceleration studies in the MINIFLAME facility, 14:52341 (R;US)
Reaction of nitric oxide with bound carbon at flame temperatures, 14:51702 (J;US)

FLAVOR MODEL
Neutron decay, semileptonic hyperon decay and the Cabibbo model, 14:53695 (R;DE)

FLOW (FLUID)
See FLUID FLOW

FLUE GAS
Electrostatic precipitation of condensed acid mist: Fourth quarterly technical progress report, June 1–August 31, 1989, 14:52149 (R;US)
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 1. Development of high reactivity sorbents. Final report, January 1986-December 1987, 14:51678 (R;US)
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 2. Pilot plant evaluation of high-reactivity sorbents. Final report, January 1986-December 1987, 14:51679 (R;US)
High temperature burner-duct-recuperator system evaluation: Final report, October 1981–August 1988, 14:52474 (R;US)
Investigation of emissions from a chipboard production plant, 14:52492 (R;GB)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a brown-coal-fueled power plant boiler, 14:52154 (R;DE;In German)
Proceedings: Fourth symposium on integrated environmental control, 14:51677 (R;US)

FLUID FLOW
See also GAS FLOW
LIQUID FLOW
TRANSITION FLOW
TURBULENT FLOW
TWO-PHASE FLOW
VORTEX FLOW
Advances in computational design and analysis of airbreathing populsion systems, 14:52926 (R;US)

FLUID MECHANICS
See also AERODYNAMICS
HYDRAULICS
HYDRODYNAMICS
Comparative study of the vorticity field in turbulent flows: Theory, experiments and computations: Second year progress report, 14:53658 (R;US)

FLUIDIZED-BED COMBUSTORS
Materials performance of commercial alloys in a simulated FBC environment, 14:52962 (B;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a circulating fluidized-bed system, 14:53192 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Scale-up of circulating fluidized bed coal combustors: Progress report, Fourth quarter, June 1, 1989–August 31, 1989, 14:51698 (R;US)
The erosivity of 600σm diameter AFBC bed material, 14:52963 (B;US)

FLUORENE
Interactive chemistry of coal-petroleum processing: Quarterly report, June 16–September 15, 1989, 14:51627 (R;US)
Novel sorbents for coal conversion wastewater treatment: Quarterly report, March 16, 1989–June 15, 1989, 14:51675 (R;US)

FLUORIDES

FLY ASH
Electrostatic agglomeration apparatus with multipole electrodes (Part 1). Presentation of the apparatus and its preliminary experiment, 14:51695 (R;JP;In Japanese)
Transport of solutes from coal ash through soil (Part 3). Effect on solute transport through soil of pH of interstitial water, 14:51673 (R;JP;In Japanese)

FOAMS
Aqueous foams for control of gas migration and water coning in aquifer gas storage, 14:51732 (R;US)

FOILS
Ultraviolet radiation effects, 14:52562 (RA;US)

FOOD
See also ANIMAL FEEDS
MEAT
MILK
Assessing multiple pathway exposures: Variability, uncertainty, and ignorance, 14:53556 (R;US)
Design, planning, application, and quality control of methods for rapid measurement of radioactivity in food and environmental samples. Draft for a working paper, 14:53881 (RA;XA)
Food irradiation. Hearing before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, One Hundredth Congress, First Session on H.R. 956, June 19, 1987, 14:53426 (B;US)
Rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, 14:52717 (RA;XA)
Recommendations of the consultants on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, 14:53882 (RA;XA)
Report of the consultants' meeting on "fallout radioactivity monitoring in environment and food" (MEF), French Nuclear Research Centre, Cadarache, France, 15-17 July 1987, 14:53421 (R;XA)
Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988, 14:52711 (R;XA)
Sanitary-dosimetric monitoring of food products, 14:52311 (RA;XA)
Some of the activities of the Radiochemistry Section at the Atominstitute of the Austrian Universities related to rapid methods for monitoring radionuclides in food and environmental samples, 14:53239 (RA;XA)

FOOD CHAINS
Intake of radionuclides through food chains as a factor in the exposure of the Soviet population after the Chernobyl accident, 14:52309 (RA;XA)
Studies on environmental radioactivity and health impact with reference to Chernobyl accident. Proceedings of the meeting organized by the Italian (AIRP) and French (SFRP) organizations of protection against radiation, 14:53232 (R;IT;In Italian French English)

FOOD IRRADIATION
See FOOD PROCESSING

FOOD PROCESSING
Economic analysis of electron accelerators and cobalt-60 for irradiating food. Technical bulletin, 14:53425 (R;US)
Electroacoustic dewatering of food and other suspensions: Phase 2, 14:52475 (R;US)

FOODSTUFFS
See FOOD

FORECASTING
Forecasting of early and delayed local complications in radiation treatment of neoplasms, 14:53391 (RA;SU;In Russian)

FORESTRY
Contribution of forestry to economic development, with special reference to employment and income in developing countries: An annotated bibliography. Working paper, 14:52388 (R;US)
Development of technology for fuel alcohol. Research and development for total system, 14:52039 (RA;JP;In Japanese)

FORESTS
Gamma-ray irradiation of a boreal forest ecosystem. The field irradiator-gamma (FIG) facility and research programs, 14:53427 (R;CA)

FORGING
Use of regenerative burners in a slot forge furnace. A demonstration at Dudley Drop Forgings Ltd., 14:52481 (R;GB)

G

GADOLINIUM
Thermochemistry of the gadolinium-copper interface, 14:52597 (J;US)

GADOLINIUM 160 TARGET
Observation of superdeformation in ^{191}Hg, 14:53792 (J;US)

GADOLINIUM COMPOUNDS
See also GADOLINIUM OXIDES
Gadolinium molybdate crystal growth for equipment of signal processing by surface acoustic waves, 14:52789 (RA;SU;In Russian)

GADOLINIUM OXIDES
Monocrystals of gallium garnets with heterovalent substitutions, 14:52796 (RA;SU;In Russian)
Numerical modeling of concentration fields in melt during growth of monocrystals of complex oxide compounds with a wide region of homogeneity (gadolinium-gallium garnet as an example), 14:52770 (RA;SU;In Russian)
Peculiarities of temperature distribution in gadolinium-gallium garnets of big diameter during their growth by the Czochralski method, 14:52771 (RA;SU;In Russian)

GAGES (PRESSURE)
See PRESSURE GAGES

GALAXY NUCLEI
Strong, spatially extended CO 7 to 6 emission from luminous cloud cores: W51 and DR21, 14:53603 (R;DE)
The 158 micron (CII) mapping of the galactic center molecular clouds, 14:53602 (R;DE)
The softest Einstein AGN [active galactic nuclei], 14:53599 (R;US)

GALLBLADDER
See BILIARY TRACT

GALLIUM
Gallium determination by radiometric stripping analysis (X ray), 14:52723 (R;BR;In Portuguese)
Gallium determination with Rodamina B: a simple method, 14:52844 (R;BR;In Portuguese)

GALLIUM 69 TARGET
β-decay half-lives, 14:53823 (RA;DE;In German)

GALLIUM 71 TARGET
β-decay half-lives, 14:53823 (RA;DE;In German)

GALLIUM 74
Structure of odd-odd ^{74}Ga from the decay of neutron-rich ^{74}Zn, 14:53775 (J;US)

GALLIUM ARSENIDE SOLAR CELLS
Cost
Gallium arsenide welded panel technology for advanced spaceflight applications, 14:52090 (RA;US)
Coverings
Domed Fresnel lens concentrator technology for space application, 14:52119 (RA;US)
Crystal Doping
N/P InP homojunction solar cells with an In0.53Ga0.47As contacting layer grown by liquid phase epitaxy, 14:52069 (RA;US)

Defects
Improved defect analysis of gallium arsenide solar cells using image enhancement, 14:52085 (RA;US)

Design
A three solar cell system based on a self-supporting, transparent AlGaAs top solar cell, 14:52082 (RA;US)
Directions for further development of GaAs/CuInSe2 thin film tandem cells, 14:52077 (RA;US)
Domed Fresnel lens concentrator technology for space application, 14:52119 (RA;US)
Flexibility in space solar cell production, 14:52089 (RA;US)

Efficiency
A new structure for comparing surface passivation materials of GaAs solar cells, 14:52084 (RA;US)
A three solar cell system based on a self-supporting, transparent AlGaAs top solar cell, 14:52082 (RA;US)
High efficiency GaAs-Ge tandem solar cells grown by MOCVD, 14:52080 (RA;US)
Investigation of high efficiency GaAs solar cells, 14:52083 (RA;US)
The 25 percent-efficient GaAs Cassegrainian concentrator cell, 14:52091 (RA;US)

Electric Contacts
Aging behavior of Au-based ohmic contacts to GaAs, 14:52086 (RA;US)

Etching
Chemical etching and organometallic chemical vapor deposition on varied geometries of GaAs, 14:52087 (RA;US)

Fabrication
Investigation of high efficiency GaAs solar cells, 14:52083 (RA;US)
Status of GaAs solar cell production, 14:52088 (RA;US)

Manufacturing
Flexibility in space solar cell production, 14:52089 (RA;US)

Meetings
Space photovoltaic research and technology, 1988. High efficiency, space environment, and array technology, 14:52065 (R;US)

Passivation
A new structure for comparing surface passivation materials of GaAs solar cells, 14:52084 (RA;US)

Performance
Predicted performance of InP solar cells in Cassegrainian and slats space concentrator arrays at 20 to 100 AM0, 80 to 100 C, 14:52070 (RA;US)

Photoemission
Improved defect analysis of gallium arsenide solar cells using image enhancement, 14:52085 (RA;US)

Physical Radiation Effects
Development of tandem cells consisting of GaAs single crystal and CuInSe2/CdZnS polycrystalline thin films, 14:52076 (RA;US)
Response of single junction GaAs/GaAs and GaAs/Ge solar cells to multiple doses of 1 MeV electrons, 14:52081 (RA;US)

Quantum Efficiency
Development of tandem cells consisting of GaAs single crystal and CuInSe2/CdZnS polycrystalline thin films, 14:52076 (RA;US)
N/P InP homojunction solar cells with an In0.53Ga0.47As contacting layer grown by liquid phase epitaxy, 14:52069 (RA;US)

Recombination
A new structure for comparing surface passivation materials of GaAs solar cells, 14:52084 (RA;US)

Standardization
Flexibility in space solar cell production, 14:52089 (RA;US)

Substrates
Gallium arsenide welded panel technology for advanced spaceflight applications, 14:52090 (RA;US)

Surface Coating
Chemical etching and organometallic chemical vapor deposition on varied geometries of GaAs, 14:52087 (RA;US)
Status of GaAs solar cell production, 14:52088 (RA;US)

Technology Assessment
Space photovoltaic research and technology, 1988. High efficiency, space environment, and array technology, 14:52065 (R;US)

Weight
Gallium arsenide welded panel technology for advanced spaceflight applications, 14:52090 (RA;US)

Welding
Gallium arsenide welded panel technology for advanced spaceflight applications, 14:52090 (RA;US)

GALLIUM ARSENIDES
Differentiation of electron-paramagnetic-resonance signals of arsenic antisite defects in GaAs, 14:52701 (J;US)
Direct observation of valence-band mixing in GaAs/GaPAs strained-layer superlattices, 14:52675 (BA;US)
Epitaxial GaAs on SOI wafers. Final report, 1 August 1988-31 January 1989, 14:52636 (R;US)
Evaluation of quasiparticle energies for semiconductors without inversion symmetry, 14:52695 (J;US)
Heteroepitaxial growth of Ge films on (100) GaAs by pyrolysis of digermane, 14:52687 (J;US)
Neutron effects in GaAs devices, 14:53100 (J;US)
Optical and structural properties of molecular-beam epitaxial GaAs on sapphire, 14:52947 (R;US)
Rapid heteroepitaxial growth of Ge films on (100) GaAs by pulsed supersonic free-jet chemical beam epitaxy, 14:52691 (J;US)
Single-filament effusion cell with reduced thermal gradient for molecular beam epitaxy, 14:52946 (R;US)
Stress release in ion implanted lattice mismatched semiconductor heterostructures, 14:52677 (BA;US)
The influence of residual contamination on the structure and properties of metal/GaAs interfaces, 14:52954 (R;US)
The structure of Al/GaAs interfaces, 14:52665 (BA;US)
Transient radiation effects in GaAs semiconductor devices, 14:53101 (J;US)
Transition from schottky limit to bardeen limit in the Schottky barrier formation of Al on n- and p-GaAs(110) interfaces, 14:52668 (BA;US)
Vacuum ultraviolet photoelectron spectroscopy of $(NH_4)_2S$-treated GaAs (100) surfaces, 14:52688 (J;US)

GALLIUM COMPOUNDS
See also GALLIUM ARSENIDES
GALLIUM OXIDES
GALLIUM PHOSPHIDES
GALLIUM SELENIDES
GALLIUM SULFIDES
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)

GALLIUM OXIDES
High-temperature raman spectroscopy study of crystallization processes of gallium garnet melts, 14:52767 (RA;SU;In Russian)
Monocrystal growth of calcium-niobium-gallium garnets by pulling at a crystal seed from cold container, 14:52788 (RA;SU;In Russian)
Numerical modeling of concentration fields in melt during growth of monocrystals of complex oxide compounds with a wide region of homogeneity (gadolinium-gallium garnet as an example), 14:52770 (RA;SU;In Russian)
On the possibility of growth of garnet structure crystals with desired thermal properties (RGa-garnets (R-rare earths, Y).), 14:52768 (RA;SU;In Russian)
Peculiarities of temperature distribution in gadolinium-gallium garnets of big diameter during their growth by the Czochralski method, 14:52771 (RA;SU;In Russian)

GALLIUM PHOSPHIDE SOLAR CELLS
Ultra-thin, light-trapping silicon solar cells, 14:52078 (RA;US)

GALLIUM PHOSPHIDES
Direct observation of valence-band mixing in GaAs/GaPAs strained-layer superlattices, 14:52675 (BA;US)
Stress release in ion implanted lattice mismatched semiconductor heterostructures, 14:52677 (BA;US)

GALLIUM SELENIDES
Composition and substrate effects on the structure of thin-film $CuGaSe_2$, 14:52630 (J;US)

GALLIUM SULFIDES
Growth of big alloyed monocrystals of cadmium thiogallate, 14:52776 (RA;SU;In Russian)

GALLSTONES
See BILIARY TRACT

GAMMA ASTRONOMY
Shower detectors for the γ-astronomy at high energies, 14:53077 (RA;DE;In German)

GAMMA DECAY
Investigation of monoenergetic pair conversion, 14:53771 (RA;DE;In German)
[Meeting of the NEANDC Task Force on decay heat predictions]: Foreign trip report, September 21, 1989–September 22, 1989, 14:52236 (R;US)

GAMMA HEATING
See RADIATION HEATING

GAMMA RADIATION
Attenuation coefficients of soils, 14:53864 (R;DD;In German)
Dose-response modeling of life shortening in a retrospective analysis of the combined data from the JANUS program at Argonne National Laboratory, 14:53541 (J;US)
IAEA research coordination meeting on X- and gamma-ray standards for detector efficiency calibration, Braunschweig, FRG, 31 May - 2 June 1989. Summary report, 14:53883 (R;XA)
Position-sensitive CdTe detector using improved crystal growth method. Final report, 14:53087 (R;US)
Shielding concerns at a spallation source, 14:51948 (RA;US)

GAMMA SPECTROMETERS
Design studies for the EUROBALL project, 14:53070 (RA;DE;In German)

GAMMA SPECTROSCOPY
Advanced methods for personal-computer-based gamma spectrum analysis, 14:52745 (J;US)
Recent advances in segmented gamma scanner analysis, 14:51909 (J;US)

GAMMA TRANSPORT THEORY
Algorithms for solving inverse problems of transport theory, 14:53866 (J;US)
Explicit solution of three-dimensional inverse transport problems, 14:53869 (J;US)
Multidimensional nodal transport methods for multiple-instruction multiple-data, distributed memory machines, 14:53870 (J;US)

GAMOW-TELLER DECAY
See GAMOW-TELLER RULES

GAMOW-TELLER RULES
Quenching of the Gamow-Teller matrix element in closed-LS-shell-plus-one nuclei, 14:53843 (R;CA)

GAMOW-TELLER THEORY
See GAMOW-TELLER RULES

GAS BURNERS
Investigation instigated to develop a reduction method for NO_x-emmission of oil and gas fired steam generators, 14:52961 (R;DE;In German)

GAS COOLANTS
See GASES

GAS ENGINES
See INTERNAL COMBUSTION ENGINES

GAS FLOW
Aqueous foams for control of gas migration and water coning in aquifer gas storage, 14:51732 (R;US)

GAS FUELS
The conversion of carbonaceous materials to clean carbon and co-product gaseous fuel, 14:52032 (R;US)

GAS FURNACES
Environmental assessment for proposed energy conservation standards for two types of consumer products; refrigerators, refrigerator-freezers, and freezers; small gas furnaces; and a proposed "No standard" standard for television sets, 14:53284 (R;US)
Rapid heating of aluminium billets by porous element burners. A demonstration at Aluminium Corporation Ltd. Dolgarrog, 14:52484 (R;GB)

GAS LASERS
See also CARBON DIOXIDE LASERS
EXCIMER LASERS
Intracavity multipass system for generation of high flux of cw visible light, 14:52921 (J;US)
Laser technology, 14:52900 (RA;JP;In Japanese)

GAS TURBINE ENGINES
Lubricant evaluation and performance. Final technical report, January 1987-June 1988, 14:51718 (R;US)
Outline of fuel/storage technology development, 14:52362 (RA;JP;In Japanese)

GAS TURBINES
See also COAL-FIRED GAS TURBINES
Transonic operational characteristics and performance of two turbine-powered simulators determined from wind tunnel tests, 14:52511 (R;JP;In Japanese)

GAS WELLS
See NATURAL GAS WELLS

GASEOUS EFFLUENTS
See GASEOUS WASTES

GASEOUS WASTES
See also EXHAUST GASES
FLUE GAS

Pollution studies of Saronikos Gulf, Greece, by neutron activation analysis, 14:52757 (J;US)
GREENHOUSE EFFECT
A compendium of options for government policy to encourage private sector responses to potential climate change: Executive summary, 14:53150 (R;US)
Global change and the changing atmosphere, 14:53140 (RA;US)
Global energy and the greenhouse issue, 14:53187 (R;US)
Global warming by carbon dioxide and other gases, 14:53154 (RA;JP;In Japanese)
Historical trends in atmospheric methane concentration and the temperature sensitivity of methane outgassing from boreal and polar regions, 14:53147 (RA;US)
Theoretical projections of stratospheric change due to increasing greenhouse gases and changing ozone concentrations, 14:53146 (RA;US)
Use of numerical models to project greenhouse gas-induced warming in polar regions (the conceptual basis developed over the last twenty years), 14:53149 (RA;US)
GROUND DISPOSAL
Report on waste burial charges: Escalation of decommissioning waste disposal costs at low-level waste burial facilities: Revision 1, 14:52332 (R;US)
GROUND WATER
Application and results of a reinjection technique for hydrothermal experiments in Dickson autoclaves, 14:51783 (R;US)
Aquifers: Ground-water treatment. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989, 14:53282 (R;US)
Biodenitrification of Hanford groundwater and process effluents: FY 1988 status report, 14:51772 (R;US)
Development of a combined quantity and quality model for optimal management of unsteady ground-water flow fields. Technical completion report, 14:53280 (R;US)
Draft liquid effluent study project plan: Revision 1, 14:51782 (R;US)
Economics of sample compositing as a screening tool in ground-water-quality monitoring, 14:53261 (R;US)
In-situ bioreclamation of contaminated ground water, 14:53260 (R;US)
Interlaboratory study of sampling and characterisation techniques for groundwater colloids, 14:53274 (R;GB)
Migration of fission products at the Nevada Test Site: Detection with an isotopic tracer, 14:53241 (R;US)
National water summary 1986: Hydrologic events and groundwater quality. Annual report, 14:53211 (R;US)
North Carolina sanitary landfills: Leachate generation, management, and water-quality impacts, 14:53263 (R;US)
Phase 2 groundwater quality assessment for the Weldon Spring site chemical plant/raffinate pits and surrounding vicinity properties: Weldon Spring Site Remedial Action Project: Revision 0, 14:51858 (R;US)
Resource Conservation and Recovery Act ground-water monitoring projects for Hanford facilities: Progress report, April 1–June 30, 1989, 14:53228 (R;US)
Superfund Record of Decision (EPA Region 6): United Nuclear Corporation, Mckinley County, New Mexico, ground-water operable unit (first remedial action) September 1988, 14:51770 (R;US)
The Louisiana Department of Natural Resources, Office of Conservation, Injection and Mining Division underground injection control program: A peer review, 14:53257 (R;US)
GROUND-WATER RESERVES

GROWTH (CRYSTAL)
See CRYSTAL GROWTH
GROWTH (GRAIN)
See GRAIN GROWTH

GROWTH FACTORS
Correlation of chromosome patterns in leukemic cells of patients with exposure to chemicals and/or radiation: Progress report, January 1, 1989–September 30, 1989, 14:53301 (R;US)
GROWTH STIMULATION
See STIMULATION
GYROTRONS
See MICROWAVE AMPLIFIERS

H

HABITAT
Fifteenmile Basin Habitat Enhancement Project: Annual report FY 1988, 14:52047 (R;US)
HADRON REACTIONS
Parton bremsstrahlung as a mechanism of energy deposition in high-energy hadron-nucleus and nucleus-nucleus collisions, 14:53857 (J;US)
HADRON-HADRON INTERACTIONS
Hard diffractive processes, 14:53734 (BA;US)
J/psi suppression, 14:53703 (RA;DE)
HAFNIUM 154
Exotic N=82 nuclei ^{153}Lu and ^{154}Hf and filling of the $\pi h_{11/2}$ subshell, 14:53788 (J;US)
HAFNIUM OXIDES
Investigation of ideality degree of hafnium dioxide monocrystals, 14:53645 (RA;SU;In Russian)
HALLEY COMET
The structure of weak cosmic ray mediated shocks, 14:53593 (RA;DE;In German)
HALOGENATED ALIPHATIC HYDROCARBONS
Determination of the acute and repeated oral toxicity of halocarbon oil, series 27-S. Interim report, December 1986-November 1987, 14:53545 (R;US)
Stratospheric ozone depletion, 14:53178 (R;US)
HALOGENS
See also CHLORINE
FLUORINE
IODINE
Photodetachment cross sections of negative halogen ions in discharge media, 14:53633 (R;US)
HAM
See MEAT
HAMILTONIAN FUNCTION
Stochasticity and symmetry of the standard map, 14:53945 (R;JP)
HANDICAPPED PEOPLE
Ridesharing and transportation for the disadvantaged. Transportation research record, 14:52375 (R;US)
HANDLING (DATA)
See DATA PROCESSING
HANDLING (WASTES)
See WASTE MANAGEMENT
HANFORD ENGINEERING DEVELOPMENT LABORATORY
Statement of John H. Anttonen, Project Manager, Basalt Waste Isolation Project, Richland Operations Office, Department of Energy, 14:51789 (BA;US)
HANFORD RESERVATION
Application and results of a reinjection technique for hydrothermal experiments in Dickson autoclaves, 14:51783 (R;US)
Application of EMCAS timeliness model to the safeguards/facility interface, 14:51893 (J;US)
Bridging the interface-the human factor, 14:51885 (J;US)
Draft liquid effluent study project plan: Revision 1, 14:51782 (R;US)
Hanford Surplus Facilities Program plan: Fiscal year 1990, 14:51781 (R;US)
Hanford chemical processing accountability system upgrade, 14:51916 (J;US)
Transmission of low-magnitude seismic excitation into Hanford Site structures, 14:53573 (R;US)
HARBORS
Amphipod bioassay of selected sediments from Sequim Bay, Washington, 14:53273 (R;US)
HARMONIC OSCILLATORS
Reduction of a wave packet in quantum Brownian motion, 14:53924 (J;US)
HARMONICS
Coherent 70.9-nm radiation generated in neon by frequency tripling the fifth harmonic of a Nd:YAG laser, 14:52894 (R;US)
HAULAGE EQUIPMENT
Group control of elevators, 14:52445 (RA;JP;In Japanese)
HAYNES 188 ALLOY
Identification of materials for hot-gas filter tubesheets: Period of performance: October 1, 1988–October 1, 1989, 14:51620 (R;US)
HAYNES ALLOYS
Identification of materials for hot-gas filter tubesheets: Period of performance: October 1, 1988–October 1, 1989, 14:51620 (R;US)
HAZARDOUS MATERIALS
Air Pollution
Suitability of diffusion and wind-field techniques for an emergency-response dispersion model. Technical memo, 14:53157 (R;US)
Classification
Compatibility coding of liquid hazardous waste, 14:51775 (R;US)
Environmental Exposure
Toxics-release inventory: A national perspective, 1987, 14:52379 (R;US)
Incinerators
Laboratory and field evaluation of a methodology for determination of hydrogen chloride emissions from municipal and hazardous-waste incinerators, 14:53185 (R;US)
Mathematical Models
Cooperative, multi-disciplinary problem solving for chemical accidents, 14:53230 (R;US)
Maximum Permissible Exposure
Industrial exposure and control technologies for OSHA (Occupational Safety and Health Administration) regulated hazardous substances. Volume 1. Substances A-I. Volume 2. Substances K-Z and indices, 14:52497 (R;US)
Minimization
Minimization of chromium-contaminated wastewater at a plating facility in the Eastern United States, 14:53139 (R;US)
Occupational Safety
Occupational safety and health guidelines for chemical hazards. (Publication No. 88-118), 14:53418 (R;US)
Plumes
Investigation of two features of continuously released heavy gas plumes. Report for September 1986-December 1988, 14:53161 (R;GB)
Pollution Sources
Analysis of air-toxics emissions, exposures, cancer risks, and controllability in five urban areas. Volume 1. Base year analysis and results, 14:53552 (R;US)
Recommendations
Occupational safety and health guidelines for chemical hazards. (Publication No. 89-104), 14:53419 (R;US)
Underground Storage
ORNL underground storage tank management guide, 14:51766 (R;US)
Waste Disposal
A review of remediation contracting practices, 14:51863 (R;US)
Applications analysis report: HAZCON solidification process, Douglassville, Pennsylvania, 14:53248 (R;US)
RCRA (Resource Conservation and Recovery Act) orientation manual, 14:52381 (R;US)
Superfund Record of Decision (EPA Region 2): Marathon Battery, NY (second remedial action), September 1988 (reannounced), 14:53247 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility, 14:53213 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra

Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 2, 14:52490 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report, 14:53215 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 1, 14:52489 (R;US)
Toxics-release inventory. Executive summary, 14:52380 (R;US)

Waste Management
Commercial treatment/recovery TSDR (treatment, storage, disposal and recycling) survey data set, 14:52498 (R;US)

Water Pollution
Scheme for the direct analysis of organics in the environment by tandem mass spectrometry, 14:53267 (R;US)

HBTX DEVICES
[High beta tokamak research]: Progress report, November 8, 1987–July 1, 1989, 14:54003 (R;US)

HCDA
See REACTOR CORE DISRUPTION

HCLWR TYPE REACTORS
Evaluation of forced reflooding experiments in APWR-geometry (NEPTUN-III facility) using the advanced computer code FLUT-FDWR, 14:52326 (R;DE)

HDO
See DEUTERIUM COMPOUNDS
HEAVY WATER

HEALTH HAZARDS
See also RADIATION HAZARDS
Occupational safety and health guidelines for chemical hazards. (Publication No. 88-118), 14:53418 (R;US)
Occupational safety and health guidelines for chemical hazards. (Publication No. 89-104), 14:53419 (R;US)
The food chain as a source of human exposure to organic chemicals, 14:53227 (R;US)

HEALTH PHYSICS
See RADIATION PROTECTION

HEART
See also MYOCARDIUM
Functional state of cardiovascular system at delayed periods following radio- and chemotherapy, 14:53460 (RA;SU;In Russian)
Monitoring chaos of cardiac rhythms, 14:53415 (R;US)
Role of constitutional factor in determination of heart size, 14:53339 (RA;SU;In Russian)

HEART DISEASE
See CARDIOVASCULAR DISEASES

HEART FAILURE
Efficiency of roentgenological investigations in diagnosis of myocardial infarction and left ventricular failure, 14:53347 (RA;SU;In Russian)
Radionuclide method in diagnosis of mitral heart failure, 14:53366 (RA;SU;In Russian)

HEAT ENGINES
See also INTERNAL COMBUSTION ENGINES
RANKINE CYCLE ENGINES
STIRLING ENGINES
Ceramic Technology for Advanced Heat Engines Project: Semiannual progress report for October 1988–March 1989, 14:52624 (R;US)

HEAT EXCHANGERS
Heat exchangers: Biofouling. January 1974-July 1989 (Citations from the COMPENDEX database). Report for January 1974-July 1989, 14:52575 (R;US)
High temperature burner-duct-recuperator system evaluation: Final report, October 1981–August 1988, 14:52474 (R;US)
Initial characterization of a modular heat exchanger with an integral heat pipe, 14:52928 (R;US)
Special problems of heat- and flow transfer in heat exchangers of HTGR type reactors, 14:52191 (RA;DE;In German)
Vibration engineering design rules for heat exchangers taking into account operational safety and environmental load, 14:52192 (RA;DE;In German)

HEAT PIPES
Heat pipes. August 1985-July 1989 (Citations from the NTIS data base). Report for August 1985-July 1989, 14:52929 (R;US)
Initial characterization of a modular heat exchanger with an integral heat pipe, 14:52928 (R;US)

HEAT PUMPS
See also SOLAR-ASSISTED HEAT PUMPS
Contribution to the theoretical and experimental study and to the modelling of a cascade mounted high temperature heat pump, 14:52439 (R;FR;In French)
Development of superheat-pump energy-collection system. Development of extremely high-efficiency compression heat pump, 14:52449 (RA;JP;In Japanese)
Evaluation of a magnetic coupling for hermetic power transmission in a Stirling-Rankine heat pump, 14:52516 (BA;US)
Laboratory study of the dynamic losses of a single speed, split system air-to-air heat pump having tube and plate fin heat exchangers, 1985–1986, 14:52451 (R;US)
Outline of fuel/storage technology development, 14:52362 (RA;JP;In Japanese)
Performance measurements for a diaphragm-coupled, free-piston Stirling engine heat pump module, 14:52515 (BA;US)

HEAT RESISTING ALLOYS
See also STEEL-CR17NI12MO3
Materials performance of commercial alloys in a simulated FBC environment, 14:52962 (B;US)
Separation and recovery of metals from zinc-treated superalloy scrap. Report of Investigations/1989, 14:52574 (R;US)

HEAT STORAGE DEVICES

Underground Storage
Tank farm surveillance and waste status summary report for July 1989, 14:51780 (R;US)

HIGH-PURITY GE DETECTORS
A nondestructive method based on gamma spectrometry for the measurements of plutonium hold-up or plutonium wastes, 14:51906 (J;US)

HIGH-VOLTAGE PULSE GENERATORS
A novel flattop current regulated energy discharge type pulsed power supply and magnet yielding 4.4 kGauss-meter for 6 milliseconds, 14:53024 (R;US)
Dielectric liquids for possible use in pulsed power switches, 14:52957 (J;US)

HIGHLY ENRICHED URANIUM
A confirmatory measurement technique for highly enriched uranium, 14:51898 (J;US)
Stationary and portable instruments for assay of HEU solids holdup at Y-12, 14:51897 (J;US)

HIGHWAYS
See ROADS

HODGKINS DISEASE
Delayed radiation injuries in case of use modifying factors in Hodgkin's disease treatment, 14:53455 (RA;SU;In Russian)

HODOSCOPES
Shower detectors for the γ-astronomy at high energies, 14:53077 (RA;DE;In German)

HOG FUEL
See WOOD WASTES

HOISTS
Group control of elevators, 14:52445 (RA;JP;In Japanese)

HOLMIUM 165 TARGET
Neutron emission from products of strongly damped reactions $^{58}Ni+^{165}Ho$ at 930 MeV, 14:53786 (J;US)

HOLMIUM BORIDES
Enhanced ultrasonic attenuation in the superconducting state of Ho-rich $Er_{1-x}Ho_xRh_4B_4$, 14:52628 (J;US)

HOLOGRAPHY
A novel holographic technique for strain and deformation measurement, 14:52936 (R;DE;In German)

HOMOPOLAR GENERATORS
Theoretical model of gravitational perturbation of current collector axisymmetric flow field. Research and development report, 14:52424 (R;US)

HOMOPOLAR MACHINES
See HOMOPOLAR GENERATORS

HOT WATER
Development of power-generation technology utilizing hot water. Investigation of reinjection mechanism of geothermal water, 14:52128 (RA;JP;In Japanese)

HOUSES
Effectiveness of sheltering against internal exposure in nuclear reactor accidents, (1). Survey on the natural air exchange rates and the structural distribution of houses, 14:51862 (R;JP;In Japanese)

HTGR PEACH BOTTOM REACTOR
See PEACH BOTTOM-1 REACTOR

HTGR TYPE REACTORS
See also HTTR REACTOR
PEACH BOTTOM-1 REACTOR
THTR-300 REACTOR
A review of gas-cooled reactor concepts for SDI [Strategic Defense Initiative] applications, 14:52195 (R;US)
Design of major components for the Modular High-Temperature Gas-Cooled Reactor, 14:52200 (BA;US)
Designing a reactor for the next generation, 14:52196 (BA;US)
Developing a reactor for today's realities and tomorrow's needs, 14:52198 (BA;US)
Economic characteristics of a smaller, simpler reactor, 14:52197 (BA;US)
Flow of catalyst particles in a flue gas desulfurization plant; mass transfer in the domain of a detached flow - two examples (desulfurization, HTGR type reactor) for the application of big computers solving technical problems, 14:52151 (RA;DE;In German)
MHTGR fuel design and quality, 14:52201 (J;US)
MHTGR technology development plan, 14:52347 (BA;US)
Research and development of HTGR fuels, 14:52189 (R;JP;In Japanese)
Safety aspects on HTR incidents, 14:52194 (RA;DE;In German)
Safety evaluation of the modular high temperature gas-cooled reactor, 14:52345 (BA;US)
Special problems of heat- and flow transfer in heat exchangers of HTGR type reactors, 14:52191 (RA;DE;In German)
Status of international HTGR development, 14:52199 (BA;US)
The challenge of licensing a reactor with passive safety characteristics, 14:52344 (BA;US)
Working report of the Institute of Reactor Components at the KFA Juelich. Scientific lectures of the commemorative colloquium held on September 2, 1987 at the KFA Juelich, 14:52190 (R;DE;In German)

HTO
See HEAVY WATER
TRITIUM COMPOUNDS

HTTR REACTOR
Depressurization test on hot gas duct, 14:52325 (R;JP;In Japanese)
Evaluation of core inlet coolant temperature of HTTR, 14:52286 (R;JP;In Japanese)

HUGENHOLTZ-PINES THEORY
See HYDROGEN

HUMAN POPULATIONS

INCIDENTS
See ACCIDENTS
INCINERATORS
Analysis of US municipal-waste-combustion operating practices, 14:52507 (R;US)
Assessing multiple pathway exposures: Variability, uncertainty, and ignorance, 14:53556 (R;US)
Investigation of pollutant emissions at sheffield municipal solid waste incinerator with assessment of long-term pollutant variability, 14:52505 (R;GB)
Laboratory and field evaluation of a methodology for determination of hydrogen chloride emissions from municipal and hazardous-waste incinerators, 14:53185 (R;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on a national statistics of plants emitting heavy metals and trace elements, 14:53197 (R;DE;In German)
Source-emission testing of classified-waste incinerator, Griffiss AFB, New York. Final report, 19-23 September 1988, 14:52501 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report, 14:53215 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility, 14:53213 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)
INCLUSION COMPLEXES
See CLATHRATES
INCOLOY 800H
Investigation of alloys for advanced steam cycle superheaters and reheaters, 14:52137 (RA;US)
INCONEL 600
Sensitization and SCC [stress corrosion cracking] study on thermally treated inconel 600, 14:52185 (J;US)
INCONEL 617
Identification of materials for hot-gas filter tubesheets: Period of performance: October 1, 1988–October 1, 1989, 14:51620 (R;US)
Investigation of alloys for advanced steam cycle superheaters and reheaters, 14:52137 (RA;US)
INCONEL ALLOYS
Microparticle impacts in space: Results from Solar Max and shuttle witness plate inspections, 14:52560 (RA;US)
INDIANA
Comparative study of blasting vibrations from Indiana surface coal mines. Report of Investigations/1989, 14:51690 (R;US)
INDIUM ARSENIDES
Stress release in ion implanted lattice mismatched semiconductor heterostructures, 14:52677 (BA;US)
INDIUM COMPOUNDS
See also INDIUM ARSENIDES
INDIUM PHOSPHIDES
Explosive crystallization of amorphous substances (Substances: V, Yb, CdTe, indium antimonides.), 14:52769 (RA;SU;In Russian)
Reculiarities of indium antimonide monocrystal growth in vertical magnetic field, 14:52780 (RA;SU;In Russian)
INDIUM ISOTOPES
β-decay half-lives, 14:53823 (RA;DE;In German)
INDIUM PHOSPHIDE SOLAR CELLS
A three solar cell system based on a self-supporting, transparent AlGaAs top solar cell, 14:52082 (RA;US)
An empirical study of the performance of APMOVPE AM0 InP homojunction solar cells as a function of emitter thickness and doping, and base doping, 14:52068 (RA;US)
Deep levels and radiation effects in p-InP, 14:52072 (RA;US)
Encapsulated diffusion of sulphur into InP, 14:52073 (RA;US)
InP shallow-homojunction solar cells, 14:52067 (RA;US)
Modelling and design of high performance indium phosphide solar cells, 14:52071 (RA;US)
N/P InP homojunction solar cells with an In0.53Ga0.47As contacting layer grown by liquid phase epitaxy, 14:52069 (RA;US)
Predicted performance of InP solar cells in Cassegrainian and slats space concentrator arrays at 20 to 100 AM0, 80 to 100 C, 14:52070 (RA;US)

Progress in indium phosphide solar cell research, 14:52066 (RA;US)

INDIUM PHOSPHIDES
Formation of dislocation structure of indium phosphide monocrystals, 14:52812 (RA;SU;In Russian)
Photoemission study of the physical nature of the InP near-surface defect states, 14:52676 (BA;US)

INDIUM SELENIDE SOLAR CELLS
Development of tandem cells consisting of GaAs single crystal and CuInSe2/CdZnS polycrystalline thin films, 14:52076 (RA;US)
Directions for further development of GaAs/CuInSe2 thin film tandem cells, 14:52077 (RA;US)

INDONESIA
Guide to investment and trade in the forest-product sectors of Southeast Asia: Indonesia, Malaysia, and the Philippines. Working paper, 14:52389 (R;US)

INDOOR AIR POLLUTION
Control of diesel exhaust emissions in underground coal mines: Fuel modifications. Open file report, September 1978-December 1988 (Final), 14:51692 (R;US)
Indoor air pollution: Health effects. January 1970-July 1989 (Citations from the COMPENDEX data base). Report for January 1970-July 1989, 14:53186 (R;US)
Site characterization for radon source potential, 14:53245 (R;US)
Statistical comparison of results of two indoor-air pilot studies. Final report, 10 December 1987-29 February 1988, 14:53177 (R;US)

Remedial investigation of landfill Pit 8 Lawrence Livermore National Laboratory Site 300, 14:53229 (R;US)

LEAD
A risk assessment for selected lead-induced health effects: An example of a general methodology, 14:53559 (J;US)
Assessment of particle and lead concentrations in the atmosphere around Associated Octel Ltd. at Ellesmere Port. Report for August 1986-January 1987, 14:53163 (R;GB)
Distribution and mobilization of arsenic and antimony species in the Coeur d'Alene River system. Research report (Technical), 14:53264 (R;US)
Inclusive production of K^* mesons in 2.1-GeV/nucleon nuclear collisions, 14:53767 (J;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their

reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Review of the national ambient air-quality standards for lead: exposure analysis methodology and validation. Staff report (Final), 14:53216 (R;US)

LEAD 208 TARGET
Coulomb scattering of aligned heavy ions, 14:53827 (RA;DE)
Excitation of giant resonances in heavy ion reactions at intermediate energies, 14:53646 (R;FR)
Forward-backward asymmetry at direct break-up of ^{6}Li, 14:53791 (RA;DE;In German)
Spectroscopic investigation of the neutron-deficient ^{220}Th, 14:53794 (RA;DE;In German)

LEAD 210
Biogeochemistry of (210)Pb and (210)Po in fresh waters and sediments. Doctoral thesis, 14:53277 (R;US)

LEAD COMPOUNDS
Review of the national ambient air-quality standards for lead: exposure analysis methodology and validation. Staff report (Final), 14:53216 (R;US)

LEAD METHOD
See ISOTOPE DATING

LEAD-ACID BATTERIES
Optimal control of photovoltaic systems by a new battery state-of-charge observer, 14:52105 (R;IT)

LEED

CEBAF [Continuous Electron Beam Accelerator Facility] linac cryogenic instrumentation requirements and a review of the available sensors, 14:53016 (R;US)
Information content of lineshapes, 14:51989 (RA;US)
Maintenance Information and Data Acquisition System (MIDAS), 14:53113 (R;US)
Sensors and detectors based on superconducting devices. July 1972-July 1989 (Citations from the International Aerospace Abstracts database). Report for July 1972-July 1989, 14:52865 (R;US)
Statiscal characteristics of measurement noise included in DME output. Compatibility check with doppler radar output, 14:53112 (R;JP;In Japanese)

MEAT
Activities regarding the monitoring of radionuclides in food and environmental samples in the department ENEA-PAS, 14:53422 (RA;XA)
CS-137 in Austrian domestic animals: determination of transfer parameters and meat contamination by live animal measurements, 14:53231 (R;AT)
Estimate of the cesium-137 activity in reindeer meat by external γ-measurement of living animal, 14:53423 (RA;XA)

MECHANICAL STRUCTURES
See also INTAKE STRUCTURES
Large-scale structural analysis: The structural analyst, the CSM Testbed and the NAS System, 14:52851 (R;US)
Location of interior impact source in randomly excited structures, 14:52873 (R;US)
Research in structures, structural dynamics and materials, 1989, 14:52531 (R;US)

MECHANICAL VIBRATIONS
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 2. Final report, 14:53567 (R;US)
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 1. Final report, 14:53566 (R;US)
Optimization of structures with passive damping and active controls. Final report, May-November 1988, 14:52853 (R;US)

MEDICAL CENTERS
See MEDICAL ESTABLISHMENTS

MEDICAL ESTABLISHMENTS
Field evaluation of direct-reading continuous ethylene oxide monitors. Final report, 14:53137 (R;US)

MEDICAL SUPPLIES
Studies of irradiation sterilization for single infusion device, 14:53420 (R;CN;In Chinese)

MEGAKARYOCYTES
See BONE MARROW CELLS

MELT REFINING PROCESS
See PYROCHEMICAL REPROCESSING

MELTDOWN
Reaction behaviour of B_4C absorber material with stainless steel and Zircaloy in severe LWR accidents, 14:52620 (R;DE)

MEMBRANE TRANSPORT
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency bioreactor, 14:52035 (RA;JP;In Japanese)
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency module, 14:52033 (RA;JP;In Japanese)

MEMBRANES
See also PHOTOSYNTHETIC MEMBRANES
Test and evaluation of polymeric membranes for oxygen enrichment of air: Final report, 14:52477 (R;US)

MEMORY DEVICES
Design and implementation of parallel MAKE, 14:54057 (R;NL)

MENDELEVIUM 259
Spontaneous fission properties of ^{258}Fm, ^{259}Md, ^{260}Md, ^{258}No, and ^{260}[104]: Bimodal fission, 14:53820 (J;US)

MENDELEVIUM 260
Spontaneous fission properties of ^{258}Fm, ^{259}Md, ^{260}Md, ^{258}No, and ^{260}[104]: Bimodal fission, 14:53820 (J;US)

MENTAL DISORDERS
Pseuchoneurotic disorders associated with the Chernobyl accident, 14:53286 (RA;XA)

MERCURY
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a fluidized-bed furnace for sewage sludge combustion, 14:53193 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a household refuse incineration plant, 14:53195 (R;DE;In German)
[Bioremediation of mercury-contaminated sites]: Foreign trip report, September 9–17, 1989, 14:53550 (R;US)

MERCURY 191
Observation of superdeformation in ^{191}Hg, 14:53792 (J;US)

MERCURY TELLURIDES
Growth processes, crystal structure and stability of properties of $Cd_xMn_yHg_{1-x-y}Te$ monocrystals ($0 \leq x \leq 0.4$; $0 \leq y \leq 0.2$), 14:52778 (RA;SU;In Russian)
Investigation of some properties of melts of compounds of A^2B^6 group, 14:52782 (RA;SU;In Russian)

MESH GENERATION
A tensor product b-spline method for 3D multi-block elliptic grid generation, 14:54040 (R;US)

MESON-DEUTERON INTERACTIONS
See DEUTERIUM TARGET

MESSENGER-RNA
Human genes for complement components C1r and C1s in a close tail-to-tail arrangement, 14:53298 (J;US)

METABOLITES
Separating the influx and efflux components of net uptake of NO_3^- and NH_4^+ with the use of isotopic fractional data: Final report, July 15, 1987–July 14, 1989, 14:53303 (R;US)

METAGALAXY
See UNIVERSE

METAL INDUSTRY
Application of combustion control, ceramic fibre lining and waste heat recovery to lead refining kettles. [Demonstration at] Britannia Refined Metals Ltd. [Gravesend], 14:52480 (R;GB)
Application of regenerative burners to a continuous heat treatment furnace. Demonstration at BSC, Shepcote Lane Works [Sheffield], 14:52483 (R;GB)
Assessment of particle and heavy-metal concentrations in the atmosphere around the Port Talbot works of the British Steel Corporation. Report for February-May 1987, 14:53162 (R;GB)
Effects of economic growth, technology change, consumption pattern change, and foreign trade on domestic demand for primary metals, 1963-82. Open File report, 14:52387 (R;US)

Activation Analysis
Applications of INAA with Ghent k_0 factors to the analysis of high-purity metals and ceramics, 14:52743 (J;US)
Air Pollution Monitoring
Assessment of particle and heavy-metal concentrations in the atmosphere around the Port Talbot works of the British Steel Corporation. Report for February-May 1987, 14:53162 (R;GB)
Corrosion
Laser Raman Spectroscopy in studies of corrosion and electrocatalysis, 14:52536 (R;US)
Electronic Structure
First-principles method for calculating electronic properties of layered structures, 14:53911 (J;US)
Erosion
The erosivity of 600σm diameter AFBC bed material, 14:52963 (B;US)
Explosive Forming
Texture and textural evolution in explosively formed jets, 14:52587 (J;US)
Hazardous Materials
Applications analysis report: HAZCON solidification process, Douglassville, Pennsylvania, 14:53248 (R;US)
Impurities
Applications of INAA with Ghent k_0 factors to the analysis of high-purity metals and ceramics, 14:52743 (J;US)
Interfaces
The influence of residual contamination on the structure and properties of metal/GaAs interfaces, 14:52954 (R;US)
Ion Implantation
Characterization techniques for ion bombarded insulators, 14:52584 (BA;US)
Generation and application of nitrogen beam, 14:52543 (RA;JP;In Japanese)
[Ion implantation of ceramics]: Foreign trip report, August 24–September 10, 1988, 14:53900 (R;US)
Laser Welding
[Fundamentals of materials processing]: Foreign trip report, December 30, 1987–January 31, 1988, 14:52572 (R;US)
Nitridation
Generation and application of nitrogen beam, 14:52543 (RA;JP;In Japanese)
Rankine-Hugoniot Equations
Projectile impact Hugoniot parameters for selected materials, 14:52577 (R;US)
Surface Hardening
Generation and application of nitrogen beam, 14:52543 (RA;JP;In Japanese)
Surface Properties
Interpretation of the linear coefficient of surface-plasmon dispersion, 14:53908 (J;US)
Surfaces
Tribology of undulated surfaces. Final report, 1 February 1986-31 January 1989, 14:52934 (R;US)
Thermodynamic Properties
New approach to the thermodynamics of condensed matter. Part 1. The specific heat, at constant pressure, of metals, 14:52540 (R;IT)
Water Pollution
Coeur d'Alene basin EPA (Environmental Protection Agency) water quality monitoring, 1972-1986, 14:53270 (R;US)

METASTASES
Lymphography in patients with malignant neoplasms of ovaries, 14:53329 (RA;SU;In Russian)
Roentgenologic peculiarities of osteogeni, 14:53323 (RA;SU;In Russian)

METEOROLOGY
National Climate Program Five-Year Plan, 1989-1993, 14:53136 (R;US)

METHACRYLIC ACID
Photoinduced charge separation by polymer-bound chromophores: Progress report, September 1986–October 1989, 14:52837 (R;US)

METHACRYLIC ACID-ALPHA
See METHACRYLIC ACID

METHANATION
Carbon monoxide rich methanation kinetics on supported rhodium and nickel catalysts, 14:52099 (R;US)

METHANE
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency module, 14:52033 (RA;JP;In Japanese)
Development of methane gas production facility combined with high efficiency separation film. Development of high-efficiency bioreactor, 14:52035 (RA;JP;In Japanese)
Historical trends in atmospheric methane concentration and the temperature sensitivity of methane outgassing from boreal and polar regions, 14:53147 (RA;US)
Marine geochemistry of methane. Doctoral thesis, 14:51731 (R;US)
Outline of alcohol biomass technological development, 14:52034 (RA;JP;In Japanese)
Physical Sciences program area: 1989 contract status report, 14:51727 (R;US)
Progress report on measurement and fitting of pulse shapes of moderators at IPNS (Intense Pulsed Neutron Source), 14:52023 (RA;US)
Reactions of ^{11}C recoil atoms in the systems H_2O-NH_3, H_2O-CH_4 and NH_3-CH_4, 14:52845 (R;DE;In German)
Rotary-drilling techniques used in the Beckley Coalbed. Report of Investigations/1989, 14:51686 (R;US)

METHANOGENIC BACTERIA
Characterization of methanogen membrane function: A genetic approach. Final report, August 1986-July 1989, 14:52031 (R;US)

METHANOL
Development of methanol-upgrading-type power-generation technology. Development of elemental technology, 14:52040 (RA;JP;In Japanese)
Energy alcohols as fuels, 14:52037 (RA;DE;In German)
Outline of alcohol biomass technological development, 14:52034 (RA;JP;In Japanese)

METHANOL FUELS
Durability testing of a Toyota LCS-M (lean combustion system-methanol) Carina. Technical report, 14:52523 (R;US)

METHYL ALCOHOL
See METHANOL

METHYL-FUEL
See ALCOHOLS
METHANOL

METHYLBENZENE

NEODYMIUM 144 TARGET
High-spin studies of ^{172,173}Os: Complex alignment mechanism, 14:53787 (J;US)
NEODYMIUM COMPOUNDS
Growth of laser crystals $CaMoO_4:Nd^{3+}$, 14:52798 (RA;SU;In Russian)
NEODYMIUM LASERS
Prototype laser-diode-pumped solid state laser transmitters. Final report, April 1987-June 1989, 14:52905 (R;US)
Ultrahigh brightness laser program, 14:52914 (BA;US)
NEON
Coherent 70.9-nm radiation generated in neon by frequency tripling the fifth harmonic of a Nd:YAG laser, 14:52894 (R;US)
NEON 20
Pion inelastic scattering to the low-lying broad 2^+ in ^{20}Ne, 14:53768 (J;US)
NEON 20 TARGET
Pion inelastic scattering to the low-lying broad 2^+ in ^{20}Ne, 14:53768 (J;US)
NEOPLASMS
See also LYMPHOMAS
SARCOMAS
Analysis of air-toxics emissions, exposures, cancer risks, and controllability in five urban areas. Volume 1. Base year analysis and results, 14:53552 (R;US)
Comparative assessment of effect of various types of radiation treatment on thyroid function in patients with pharynx neoplasm, 14:53396 (RA;SU;In Russian)
Intraoperative radiation therapy: Characterization and application. Master's thesis, 14:53315 (R;US)
Modern possibilities of complex introscopic diagnosis of stomach cancer, 14:53334 (RA;SU;In Russian)
Modern possibilities of radiological investigation methods in diagnosis and evaluation of lung cancer therapy efficiency, 14:53340 (RA;SU;In Russian)
Study on mobility of stomach antral part during preoperative radiotherapy, 14:53367 (RA;SU;In Russian)
The oncogenic action of ionizing radiation on rat skin: Progress report, February 1, 1987–January 31, 1990, 14:53431 (R;US)
Use of superconducting plates and shells to deflect magnetic noise fields: Application to MEG [magnetoencephalography], 14:53406 (R;US)
Worldwide studies of household radon exposure and lung cancer, 14:52436 (R;US)
[Radiation protection]: Foreign trip report, November 8, 1986–November 21, 1986, 14:53532 (R;US)
[Radiation susceptibility]: Foreign trip report, March 15–23, 1988, 14:53534 (R;US)
NEPTUNIUM 236 TARGET
Cross section of ^{236}Np fission by 10 keV neutrons, 14:53797 (RA;SU;In Russian)
Some neutron and photon reactions on the ground and isomeric states of ^{236,237}Np, 14:53819 (R;US)
NEPTUNIUM 237 TARGET
Absolute measurements of ^{233}U, ^{235}U, ^{237}Np fission cross sections by 1.9 and 2.4 MeV neutrons by the method of time correlated associated particles, 14:53813 (RA;SU;In Russian)
Character of ν-bar$_p$ dependence on excitation energy and spins of fissile nuclei, 14:53807 (RA;SU;In Russian)

Determination of the cross sections of delayed neutron production at microtron M-30, 14:53808 (RA;SU;In Russian)
Some neutron and photon reactions on the ground and isomeric states of ^{236,237}Np, 14:53819 (R;US)

NEPTUNIUM COMPLEXES
Cyclic voltammetric study of organoactinide compounds of uranium(IV) and neptunium(IV). Ligand effects on the M(IV)/M(III) couple, 14:52847 (J;US)

NEPTUNIUM ISOTOPES
Fission yield in odd nuclei fission by neutrons, 14:53810 (RA;SU;In Russian)

NEUTRON SOURCES
ISIS status report, 14:52008 (RA;US)
Pulsed-neutron production at the Brookhaven 200-MeV linac, 14:51979 (RA;US)

Computerized Simulation
Monte Carlo simulation of the LANSCE target/moderator/reflector/shield geometry, 14:51967 (RA;US)

Control Systems
Liquid-hydrogen-control-system modifications, 14:51981 (RA;US)

Data Acquisition Systems
Future data acquisition at ISIS, 14:51977 (RA;US)
New KENS data acquisition system, 14:51976 (RA;US)

Data Analysis
Maximum entropy methods in neutron scattering: Application to the structure factor problem in disordered materials, 14:51990 (RA;US)
The performance of maximum entropy methods in spectral deconvolution, 14:52024 (RA;US)

Data Processing
Introduction to maximum entropy, 14:51954 (RA;US)

Design
Design calculations for the ANS (Advanced Neutron Source) cold source, 14:51953 (RA;US)
Information content of lineshapes, 14:51989 (RA;US)
Scattering cross sections and transport properties of H_2 and D_2 as obtained from a synthetic model, 14:51972 (RA;US)
Status report of SINQ: A continuous spallation neutron source, 14:51946 (RA;US)
Summary of contribution to the ICANS-X panel discussion, 14:51985 (RA;US)
Summary of contribution to the ICANS-X panel discussion, 14:52021 (RA;US)
Summary of the contributions to the ICANS-X panel discussion, 14:51987 (RA;US)
The ASPUN project, 14:52014 (RA;US)
The D_2 cold-neutron source for SINQ, 14:51969 (RA;US)
The U.S. Advanced Neutron Source, 14:51988 (RA;US)
Upgrading of the reactor BER II, 14:51973 (RA;US)
[Research on neutron sources]: Foreign trip report, December 15–16, 1986, 14:52026 (R;US)

Lectures
Summaries and future projections, 14:52007 (RA;US)

Measuring Instruments
Development of a chopper spectrometer at Kens, 14:51957 (RA;US)
Developments in inelastic instrumentation at ISIS, 14:51956 (RA;US)
Information content of lineshapes, 14:51989 (RA;US)
New instruments at IPNS (Intense Pulsed Neutron Source): POSY II and SAD II, 14:51955 (RA;US)
Summary of contribution to the ICANS-X panel discussion, 14:52020 (RA;US)

Moderators
A combined H_2/CH_4 cold moderator for a short pulsed neutron source, 14:52019 (RA;US)
A consideration of cold neutron source for KENS-II, 14:51994 (RA;US)
Cold moderator scattering kernels, 14:51950 (RA;US)
Cold moderators for spallation sources, 14:51951 (RA;US)
New moderator for pulsed neutron diffraction, 14:51974 (RA;US)
Preliminary optimization experiments of coupled liquid hydrogen moderator for KENS-II, 14:51996 (RA;US)
Progress report on measurement and fitting of pulse shapes of moderators at IPNS (Intense Pulsed Neutron Source), 14:52023 (RA;US)
Upgrades to the ISIS moderator configuration, 14:51978 (RA;US)

Neutron Absorbers
Nuclear criticality safety assessment calculations: Part 1, Calculating power histories in nuclear excursions, 14:52327 (R;US)

Neutron Detectors
Detector development at the ISIS facility, 14:51975 (RA;US)

Neutron Diffractometers
GLAD: The IPNS (Intense Pulsed Neutron Source) Glass, Liquid, and Amorphous materials Diffractometer, 14:52018 (RA;US)
Time-of-flight small-angle-neutron-scattering data reduction and analysis at LANSCE (Los Alamos Neutron Scattering Center) with program SMR, 14:51963 (RA;US)

Neutron Flux
Experimental determination of neutron beam fluxes at LANSCE (Los Alamos Neutron Scattering Center) from gold foil activation, 14:51968 (RA;US)
LANSCE (Los Alamos Neutron Scattering Center) steady-state unperturbed thermal neutron fluxes at 100 μA, 14:51970 (RA;US)

Neutron Guides
On the use of acceptance diagrams to calculate the performance of multiple-section straight-sided neutron guide systems, 14:52000 (RA;US)
SINQ guide concept, 14:52002 (RA;US)

Neutron Spectra
Neutron spectrum measurement, LANSCE/ER-1, 14:52005 (RA;US)

Neutron Spectrometers
A comparison of germanium and copper analyzers for pulsed-source crystal-analyzer spectrometers, 14:51961 (RA;US)
On the kinematics and resolution of spectrometers for neutron Brillouin scattering, 14:52015 (RA;US)
Recent results with the Los Alamos Constant-Q spectrometer, 14:52017 (RA;US)
Some considerations on TOF-NSE (Time-Of-Flight-Neutron Spin Echo), 14:51964 (RA;US)
The effects of chopper jitter on the time-dependent intensity transmitted by multiple-slot multiple disk chopper systems, 14:52016 (RA;US)
The new chopper spectrometer at LANSCE [Los Alamos Neutron Scattering Center] , PHAROS, 14:51962 (RA;US)

Operation
Status of the intense pulsed neutron source, 14:52009 (RA;US)

Optical Equipment
Summary of the recent conference on thin-film neutron optical devices, 14:52004 (RA;US)

Research Programs
[Advanced neutron source research]: Foreign trip report, February 7–21, 1987, 14:52027 (R;US)

Shielding
Shielding concerns at a spallation source, 14:51948 (RA;US)

Shields
Equivalent spherical-shield-neutron-dose calculations, 14:51998 (RA;US)
Infinite slab-shield dose calculations, 14:51999 (RA;US)
Measured neutron beam line shielding effectiveness of several iron/polyethylene configurations, 14:51997 (RA;US)

Specifications
The advanced MAPLE reactor concept, 14:51952 (RA;US)
User requirements as they impact spallation neutron source design, 14:51986 (RA;US)

Targets
LANSCE (Los Alamos Neutron Scattering Center) target calculations, 14:51983 (RA;US)
LANSCE (Los Alamos Neutron Scattering Center) target system performance, 14:51971 (RA;US)
Remote handling for an ISIS target change, 14:51982 (RA;US)
Some neutronic calculations for KENS-II, 14:51993 (RA;US)
Target system materials and engineering problems, 14:51949 (RA;US)
The ISIS target, 14:51947 (RA;US)
The ISIS target halo monitors, 14:52006 (RA;US)
The LANSCE (Los Alamos Neutron Scattering Center) target data collection system, 14:51980 (RA;US)

Technology Assessment
Advanced spallation sources; scientific opportunities and technical feasibility, 14:52022 (RA;US)
Summary of contribution to the ICANS-X panel discussion, 14:51984 (RA;US)

Uses
Application of eV neutron scattering and eV neutron absorption techniques, 14:51959 (RA;US)

NEUTRON SPECTROMETERS
A comparison of germanium and copper analyzers for pulsed-source crystal-analyzer spectrometers, 14:51961 (RA;US)
Development of a chopper spectrometer at Kens, 14:51957 (RA;US)
Developments in inelastic instrumentation at ISIS, 14:51956 (RA;US)
Neutron beam compressors for pulse width reduction, 14:52003 (RA;US)
On the kinematics and resolution of spectrometers for neutron Brillouin scattering, 14:52015 (RA;US)
Optimal Larmor precession magnets: Application to neutron spin echo, 14:51965 (RA;US)
Optimization of reconstruction algorithms using Monte Carlo simulation, 14:51991 (RA;US)
Recent results with the Los Alamos Constant-Q spectrometer, 14:52017 (RA;US)
Some considerations on TOF-NSE (Time-Of-Flight-Neutron Spin Echo), 14:51964 (RA;US)
The effects of chopper jitter on the time-dependent intensity transmitted by multiple-slot multiple disk chopper systems, 14:52016 (RA;US)
The new chopper spectrometer at LANSCE [Los Alamos Neutron Scattering Center] , PHAROS, 14:51962 (RA;US)
The performance of maximum entropy methods in spectral deconvolution, 14:52024 (RA;US)

NEUTRON STARS
Neutron starquakes and the nature of gamma-ray bursts, 14:53584 (RA;FR)
Relativistic shocks in electron-positron plasmas and polar cap accretion onto neutron stars: Two non-linear problems in astrophysical plasma physics, 14:53579 (RA;FR)

NEUTRON TRANSPORT
Analysis of the source range monitor during the first four hours of the Three Mile Island Unit 2 accident, 14:52357 (J;US)

NEUTRON TRANSPORT THEORY
Algorithms for solving inverse problems of transport theory, 14:53866 (J;US)
Explicit solution of three-dimensional inverse transport problems, 14:53869 (J;US)
Multidimensional nodal transport methods for multiple-instruction multiple-data, distributed memory machines, 14:53870 (J;US)
The use of the inverse Monte Carlo method in nuclear engineering, 14:53868 (J;US)
Use of adjoint transport solutions for inverse problems, 14:53867 (J;US)

Influence of short range chemical order on density of states in α-ZrNi, 14:52544 (R;BR;In Portuguese)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 45 t/h steam boiler fueled with heavy oil, 14:53188 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a 25 t/h steam boiler fueled with heavy oil, 14:53189 (R;DE;In German)
Surface and thin-film photoemission spectrum of nickel metal: A many-body solution to a two-dimensionally periodic cluster, 14:52600 (J;US)

NICKEL 58 REACTIONS
Construction of a new parallel-plate detector for the crystal ball, 14:53071 (RA;DE;In German)
Neutron emission from products of strongly damped reactions $^{58}Ni+^{165}Ho$ at 930 MeV, 14:53786 (J;US)

NICKEL 58 TARGET
Construction of a new parallel-plate detector for the crystal ball, 14:53071 (RA;DE;In German)
Coulomb scattering of aligned heavy ions, 14:53827 (RA;DE)
Direct decay of giant resonances in medium-heavy nuclei, 14:53773 (RA;DE;In German)
Proton propagation in nuclei studied in the *A* dependence of the $(e,e'p)$ reaction in the quasifree region, 14:53762 (J;US)
The interference term between nuclear charge and nuclear current matrix elements of the E1 giant resonance in ^{12}C and ^{58}Ni, 14:53760 (RA;DE;In German)

NICKEL 60 TARGET
Direct decay of giant resonances in medium-heavy nuclei, 14:53773 (RA;DE;In German)

NICKEL 64 TARGET
Lifetime measurement of compound nuclei via neutron-neutron correlations, 14:53774 (RA;DE;In German)

NICKEL ALLOYS
See also ALLOY-RA-333
CHROMIUM-NICKEL STEELS
Bulk and surface vibrational modes in NiAl, 14:52593 (J;US)
Effects of neutron irradiation to 63 dpa on the properties of various commercial copper alloys, 14:52542 (R;US)
Elastic properties of superlattices, 14:52583 (BA;US)
Literature review of workability and phase stability relative to advanced austenitic alloys in steam service, 14:51652 (R;US)
Nickel beryllides and their properties, 14:52537 (R;US)
Theoretical analysis of compatibility of several reinforcement materials with NiAl and FeAl matrices, 14:52656 (R;US)
[Creep cavitation in nickel aluminides]: Foreign trip report, August 9, 1987–August 16, 1987, 14:52571 (R;US)

NICKEL COMPOUNDS
See also NICKEL OXIDES
NICKEL SILICIDES
NICKELATES
Crystal chemistry, magnetic and electrical properties of La(2-x)Ba$_x$NiO$_4$, 14:52608 (R;US)
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)

NICKEL ISOTOPES
Isospin asymmetries in pion scattering to isoscalar giant quadrupole states in Ni isotopes, 14:53772 (J;US)

NICKEL OXIDES
Ab initio multicenter tight-binding model for molecular-dynamics simulations and other applications in covalent systems, 14:52635 (J;US)

NICKEL SILICIDES
Experimental evidence for nucleation during thin-film reactions, 14:52586 (J;US)
X-ray standing-wave analysis with high reflection order and near-normal incidence, 14:52705 (J;US)

NICKEL-CHROMIUM STEELS
Investigation of alloys for advanced steam cycle superheaters and reheaters, 14:52137 (RA;US)

NICKEL-HYDROGEN BATTERIES
Terrestrial nickel/hydrogen battery development at Johnson Controls, Inc., 14:52371 (R;US)

NICKELATES
Crystal chemistry, magnetic and electrical properties of La(2-x)Ba$_x$NiO$_4$, 14:52608 (R;US)

NIOBATES
Crystal growth of LiNbO$_3$:Y with regular domain structure in [011-bar2] direction, 14:52804 (RA;SU;In Russian)
Crystal growth of ferroelectric $Ba_2LiNb_5O_{15}$, 14:52795 (RA;SU;In Russian)
Double alloying and photoinduced properties of lithium niobate crystals, 14:52792 (RA;SU;In Russian)
Growth and properties of alloyed crystals of BSN and LiNbO$_3$, 14:52793 (RA;SU;In Russian)

NIOBIUM
Experimental evidence for nucleation during thin-film reactions, 14:52586 (J;US)
Resonant enhancement of inverse photoemission transitions in bulk niobium, 14:52599 (J;US)

NIOBIUM 93 TARGET
Properties of the giant dipole resonance built on the isobaric analog state, 14:53764 (J;US)

NIOBIUM ADDITIONS
Effect of niobium doping on the properties of molybdenum sulfides as cathode materials, 14:52365 (R;US)

NIOBIUM ALLOYS
See also NIOBIUM ADDITIONS
NIOBIUM BASE ALLOYS
Elastic properties of superlattices, 14:52583 (BA;US)

NIOBIUM BASE ALLOYS
Flux creep in multifilamentary conductors of NbTi and Nb_3Sn, 14:52533 (R;US)

NIOBIUM COMPOUNDS
See also NIOBATES
NIOBIUM OXIDES
Experimental evidence for nucleation during thin-film reactions, 14:52586 (J;US)
Growth and investigation of germanate LiNbGeO$_5$ monocrystals, 14:52799 (RA;SU;In Russian)
Growth of laser crystals $CaMoO_4:Nd^{3+}$, 14:52798 (RA;SU;In Russian)
Intercalated compounds of niobium and tantalum dicalcogenides, 14:52726 (R;BR;In Portuguese)

NIOBIUM OXIDES
Control of etching of LiNbO$_3$ by implant damage profile tailoring, 14:53906 (BA;US)
Elastic-recoil-detection measurement of instabilities in proton-exchanged lithium niobate, 14:52627 (BA;US)
High-temperature raman spectroscopy study of crystallization processes of gallium garnet melts, 14:52767 (RA;SU;In Russian)
Low-melting laser garnets. Investigation of structure defects, 14:52808 (RA;SU;In Russian)
Monocrystal growth of calcium-niobium-gallium garnets by pulling at a crystal seed from cold container, 14:52788 (RA;SU;In Russian)
Monocrystals of gallium garnets with heterovalent substitutions, 14:52796 (RA;SU;In Russian)

NIOSH
Health promotion/hazard protection at the workplace: A NIOSH (National Institute for Occupational Safety and Health) position and planning guide, 14:53417 (R;US)

NITRATES
See also PLUTONIUM NITRATES
URANIUM NITRATES
Heterogeneous chemical processes in ozone depletion, 14:53144 (RA;US)
Time-resolved size distributions of sub-4 micrometers particle sulfur and nitrate. Final report, 14:53182 (R;US)

NITRIC OXIDE
Reaction of nitric oxide with bound carbon at flame temperatures, 14:51702 (J;US)

NITRIDES
See also BORON NITRIDES
SILICON NITRIDES
SULFUR NITRIDES
Nitrogen ceramics meeting in France, 14:52606 (R;US)

NITRO COMPOUNDS
Propagation of detonation waves from an impact region, 14:53125 (R;US)
The influence of an external electric field on the X-ray scattering of 2-methyl-4-nitroaniline, an organic crystal with nonlinear optical properties, 14:53915 (J;DK)

NITROGEN
Current status and future aspect of nitrogen plasma, 14:53641 (RA;JP;In Japanese)
Electrolytic dissociation process in nitrogen and produced species, 14:53642 (RA;JP;In Japanese)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Neutron Brillouin scattering in dense nitrogen gas, 14:51958 (RA;US)
Role of N_2 in laser excitation, 14:52901 (RA;JP;In Japanese)
The Bevatron liquid nitrogen circulation system, 14:53043 (BA;US)

NITROGEN DIOXIDE
Micrometeorological investigation of surface exchange of trace gases: A case study. Technical memo, 14:53179 (R;US)
Synergistic effects of nitrogen dioxide and carbon dioxide following acute inhalation exposures in rats, 14:53554 (R;US)

NITROGEN HYDRIDES
See also AMMONIA
State-resolved cross sections for rotationally inelastic collisions of NH_2(x2B1 state) with helium, 14:53635 (R;US)

NITROGEN IONS
Generation and application of nitrogen beam, 14:52543 (RA;JP;In Japanese)

NITROGEN NITRIDES
See NITROGEN

NITROGEN OXIDES
See also NITRIC OXIDE
NITROGEN DIOXIDE
NITROUS OXIDE
An empirical computer model of the F-Area A-Line nitrogen oxides absorption column (F-8 Column), 14:52736 (R;US)
Computer simulation of a nitrogen oxides absorption column at the Savannah River Site, 14:52875 (R;US)
Evaluation of internally staged coal burners and sorbent-jet aerodynamics for combined SO_2/NOx control in utility boilers.

Volume 1. Testing in a 10 million Btu/hr experimental furnace. Final report, October 1982-June 1985, 14:52153 (R;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
NO_x discharge from spreader stoker boilers: literature study, 14:51699 (R;SE)
Production of NOX and processing, 14:53155 (RA;JP;In Japanese)
Study of the NO_3 radical decomposition reaction and the N_2O_5 in equilibrium with NO_3 + NO_2 equilibrium constant. Final report, 14:53181 (R;US)

NITROGEN SULFIDES
See SULFUR NITRIDES

NITROUS OXIDE
High-temperature photochemistry kinetics studies of the reactions of H(1(2)s) and D(1(2)S) with N_2O, 14:52836 (R;US)
Kinetic modeling of artifacts in the measurement of N_2O from combustion sources, 14:52155 (J;US)

NMR
See NUCLEAR MAGNETIC RESONANCE

NMR SPECTRA
Structural study of pyrones by NMR, 14:52765 (R;BR;In Portuguese)
Study on effect of substituents in α positron of N,N-diethylamides by nuclear magnetic resonance, 14:53887 (R;BR;In Portuguese)
Substitution effect in nuclear magnetic resonance of C-13: α methoxicyclohexanones, 14:52764 (R;BR;In Portuguese)

NOBELIUM 258
Spontaneous fission properties of ^{258}Fm, ^{259}Md, ^{260}Md, ^{258}No, and $^{260}[104]$: Bimodal fission, 14:53820 (J;US)

NOBLE GASES
See RARE GASES

NOISE POLLUTION
Research on noise and environmental issues. Transportation Research Record, 14:53169 (R;US)

NOISE POLLUTION ABATEMENT
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 2. Final report, 14:53567 (R;US)
Research on noise and environmental issues. Transportation Research Record, 14:53169 (R;US)

NOISE POLLUTION CONTROL
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 1. Final report, 14:53566 (R;US)

NONDESTRUCTIVE ANALYSIS
See also ION MICROPROBE ANALYSIS
X-RAY EMISSION ANALYSIS
Sources of measurement error in plutonium solids isotopic assay measurements, 14:51920 (J;US)

NONLEPTONIC DECAY
See WEAK HADRONIC DECAY

NONLINEAR PROBLEMS
A framework for studying genetic optiization of complex systems, 14:54055 (R;US)
Nonlinear maps with competitive interactions: Fixed-points, bifurcations, and chaotic attractors, 14:54056 (R;US)
Parallel processing of central-difference transient analysis for three-dimensional nonlinear framed structures, 14:54035 (R;US)

NONLINEAR SYSTEMS
See NONLINEAR PROBLEMS

NONLUMINOUS MATTER
Gamma ray lines from dark matter annihilation, 14:53589 (R;US)
Weakly interacting massive particles and stellar structure, 14:53598 (R;FR)

NONRADIOACTIVE WASTE DISPOSAL
See WASTE DISPOSAL

NORTH ANNA-1 REACTOR
Human engineering considerations in the design of New Virginia Power Radwaste facilities, 14:52282 (J;US)
The cost of operating with failed fuel at Virginia power, 14:52179 (J;US)

Petroleum marketing monthly, July 1989, 14:51721 (R;US)
Petroleum marketing monthly, May 1989, 14:51720 (R;US)
The reality of the greenhouse effect, 14:51723 (BA;US)
PETROLEUM RESIDUES
Coprocessing of coal with heavy oil and petroleum residuals, 14:51630 (RA;US)
Enhanced reactivity and selectivity in coal liquefaction and coprocessing systems: Coprocessing and coal liquefaction with novel catalysts, 14:51633 (RA;US)
PETT
See POSITRON COMPUTED TOMOGRAPHY
PHANTOMS
Monitoring of internal exposure of the population in regions close to the Chernobyl nuclear power plant, 14:52317 (RA;XA)
PHARMACOTHERAPY
See CHEMOTHERAPY
PHARYNX
Radiation injuries of the pharynx, 14:53454 (RA;SU;In Russian)
PHENANTHRENE
Photoinduced charge separation by polymer-bound chromophores: Progress report, September 1986–October 1989, 14:52837 (R;US)
PHENOLS
Bioprocessing of lignite coals using reductive microorganisms: Progress report number one, September 30, 1988–February 1, 1989, 14:51640 (R;US)
Explorations of mechanisms regulating ectomycorrhizal colonization of boron-fertilized pine: Quarterly report, July 1, 1989–September 30, 1989, 14:52055 (R;US)
Novel sorbents for coal conversion wastewater treatment: Quarterly report, March 16, 1989–June 15, 1989, 14:51675 (R;US)
PHENYLAMINE
See ANILINE
PHILIPPINES
Guide to investment and trade in the forest-product sectors of Southeast Asia: Indonesia, Malaysia, and the Philippines. Working paper, 14:52389 (R;US)
PHOSPHATE GLASS
Transition-metal ions in Nd-doped glasses, 14:52670 (BA;US)
PHOSPHONIC ACID ESTERS
Metal ion complexation by ionizable crown ethers: Progress report, September 1988–August 1989, 14:52763 (R;US)
PHOSPHORESCENCE
Optically stimulated luminescence (OSL), 14:52648 (RA;DE;In German)
PHOSPHORIC ACID
Overall technological development of phosphoric-acid fuel cell. Development of 200-kW-class electric-power-generating system for business use, 14:52432 (RA;JP;In Japanese)
PHOSPHORUS COMPOUNDS
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)
PHOSPHORYLASES
See PHOSPHOTRANSFERASES

PHOSPHOTRANSFERASES
Correlation of chromosome patterns in leukemic cells of patients with exposure to chemicals and/or radiation: Progress report, January 1, 1989–September 30, 1989, 14:53301 (R;US)
Rous sarcoma virus transforming protein tyrosine kinase is expressed and active in sarcoma-free avian embryos microinjected with Rous sarcoma virus, 14:53299 (J;US)
PHOTOCATHODES
Laser driven photocathode studies for high gradient accelerators, 14:53040 (BA;US)
PHOTODETECTORS
Low-temperature photoluminescence studies of mercuric-iodide photodetectors, 14:52634 (J;US)
PHOTOELECTROLYSIS
Innovation in photoelectrodes for the splitting of water, 14:52029 (R;US)
PHOTOFISSION
Determination of the cross sections of delayed neutron production at microtron M-30, 14:53808 (RA;SU;In Russian)
Present status of delayed neutron investigations. Justification of choice of systematization parameters of delayed neutron total absolute yields, 14:53809 (RA;SU;In Russian)
PHOTOIONIZATION
Quantum-electrodynamical approach to multiphoton ionization in the high-intensity field, 14:53632 (R;US)
PHOTOMAGNETOELECTRIC EFFECT
See MAGNETIC FIELDS
PHOTOMETERS
The Allegheny Observatory search for planetary systems. Final technical report, 1980-1988, 14:53608 (R;US)
PHOTON DETECTION (X-RAY)
See X-RAY DETECTION
PHOTOSYNTHESIS
[The physics and chemistry of microalgal photosynthesis]: Foreign trip report, September 1-20, 1989, 14:52098 (R;US)
PHOTOSYNTHETIC MEMBRANES
[Electron transfer mechanisms in reaction centers]: Final progress report, 14:52056 (R;US)
PHOTOSYNTHETIC REACTION CENTERS
Site-directed mutagenesis in photosystem II of the cyanobacterium Synechocystis sp. PCC 6803: Donor D is a tryosine residue in the D2 protein, 14:52104 (J;US)
PHOTOVOLTAIC CELLS
See also SOLAR CELLS
Research on high-efficiency, multiple-gap, multijunction, amorphous-silicon-based alloy thin-film solar cells: Semiannual subcontract report, 1 March 1988–31 August 1988, 14:52102 (R;US)
PHOTOVOLTAIC CONVERSION
Development of photovoltaic power generation technology. Development of high efficient production technology for amorphous solar cell, 14:52097 (RA;JP;In Japanese)
Latest trend of photovoltaic-power generation for energy conversion, 14:52106 (RA;JP;In Japanese)
PHOTOVOLTAIC EFFECT
Space photovoltaic research and technology, 1988. High efficiency, space environment, and array technology, 14:52065 (R;US)
PHOTOVOLTAIC POWER PLANTS
Consideration on data sampling speed for energetic measurement of photovoltaic power generating system, 14:52107 (RA;JP;In Japanese)
Development of photovoltaic power generation technology. Development of high efficient production technology for amorphous solar cell, 14:52097 (RA;JP;In Japanese)
Development of photovoltaic power generation technology. Development of high-efficient fabrication technology for crystal system solar cell, 14:52096 (RA;JP;In Japanese)
Development of photovoltaic-power generation technology. Research and development for control technology verification of connection to electric power system, 14:52112 (RA;JP;In Japanese)
Latest trend of photovoltaic-power generation for energy conversion, 14:52106 (RA;JP;In Japanese)
Optimal control of photovoltaic systems by a new battery state-of-charge observer, 14:52105 (R;IT)
Photovoltaic power system considerations for future lunar bases, 14:52108 (R;US)
PHOTOVOLTAIC POWER SUPPLIES
Energy storage and thermal control system design status, 14:52110 (R;US)
Space photovoltaic research and technology, 1988. High efficiency, space environment, and array technology, 14:52065 (R;US)
Space power technology 21: Photovoltaics, 14:52111 (RA;US)
PHTHALATES
The utilization of fillers and reinforcements to develop an optimal DAP [diallyl phthalate] molding compound, 14:52654 (R;US)
PHYSICAL PROPERTIES
Compatibility coding of liquid hazardous waste, 14:51775 (R;US)
PHYSICAL RADIATION EFFECTS
Effects of neutron irradiation to 63 dpa on the properties of various commercial copper alloys, 14:52542 (R;US)
Solar radiation, 14:52566 (RA;US)
Working group written presentation: Atomic oxygen, 14:52567 (RA;US)
Working group written presentation: Solar radiation, 14:52568 (RA;US)
Working group written presentation: Trapped radiation effects, 14:53097 (RA;US)
PIERCE ELECTRON GUNS
Computer simulation of bounded plasmas, 14:53971 (D;US)
PIGE ANALYSIS
See PROTON REACTIONS
PINCH EFFECT
Laboratory plasma studies. Final report, 14:53657 (R;US)
PINNING FORCE

COLLISIONLESS PLASMA
LASER-PRODUCED PLASMA
OPTICALLY THICK PLASMA
Abstracts submitted for the thirty-first annual meeting, Division of Plasma Physics, November 13–17, 1989, 14:53962 (R;US)
Characteristic finite element method for the vlasov-poisson system, 14:53979 (J;US)
Computer simulation of bounded plasmas, 14:53971 (D;US)
Generation and application of nitrogen beam, 14:52543 (RA;JP;In Japanese)
Manufacturing equipment for semiconductor and N_2 plasma, 14:52647 (RA;JP;In Japanese)
Particle beam technology, 14:52646 (RA;JP;In Japanese)
Patches of electrons and electron sheets for the 1-D Vlasov-Poisson equation, 14:53974 (D;US)
Plasma and energy technology, 14:52529 (RA;JP;In Japanese)
Plasma processing technology, 14:52527 (RA;JP;In Japanese)
Technology for high intensity light source, 14:52859 (RA;JP;In Japanese)
Technology of processing and welding by plasma, 14:52528 (RA;JP;In Japanese)
[Review of the status of atomic and molecular data for fusion edge plasma studies]: Foreign trip report, September 9, 1989–September 16, 1989, 14:53958 (R;US)
PLASMA (BLOOD)
See BLOOD PLASMA
PLASMA ACCELERATORS
See PLASMA GUNS
PLASMA DENSITY
Particle exhaust schemes in the DIII-D advanced divertor configuration, 14:53991 (R;US)
Shock-associated plasma density fluctuations in the interstellar medium, 14:53581 (RA;FR)
PLASMA DIAGNOSTICS
A method to measure magnetic field perturbations in plasma devices, 14:53983 (J;US)
An elliptical spectrograph/fiber-array/streak camera system for remote time-resolved spectral measurements in the x-ray region, 14:53982 (J;US)
Time-of-flight potential diagnostics for tandem mirrors, 14:53968 (D;US)
Two-dimensional plasma-electron temperature measurements, 14:53984 (J;US)
PLASMA EXPANSION
Dynamics of a plasma expanding into a uniform magnetic field, 14:53631 (J;US)
PLASMA GUNS
Electrothermal accelerators, 14:54020 (J;US)
Railgun rail gouging by hypervelocity sliding contact, 14:54017 (J;US)
Use of a two-stage light-gas gun as an injector for electromagnetic railguns, 14:52987 (J;US)
PLASMA INSTABILITY
Effect of wave localization on plasma instabilities, 14:53970 (D;US)
Effects of unequal particle number densities on Alfven waves, 14:53582 (RA;FR)
Modification of MHD activity by lower hybrid current drive, 14:53659 (R;IT)
Nonlinear oblique whistlers: Their relevance to nonthermal coupling of ions and electrons in accretion flow and supercritical quasi-perpendicular collisionless shocks, 14:53587 (RA;FR)
Relativistic MHD from two-fluid hydrodynamics (TFHD), 14:53580 (RA;FR)
Relativistic shocks in electron-positron plasmas and polar cap accretion onto neutron stars: Two non-linear problems in astrophysical plasma physics, 14:53579 (RA;FR)
Simulation of electrostatic ion instabilities in the presence of parallel currents and transverse electric fields, 14:53933 (RA;FR)
The electron beam instability revisited: Growth above and below f sub p, 14:53577 (RA;FR)
PLASMA JETS
Global kinetic theory of astrophysical jets, 14:53586 (RA;FR)
PLASMA OSCILLATIONS
See PLASMA WAVES
PLASMA PRODUCTION
Role of N_2 in laser excitation, 14:52901 (RA;JP;In Japanese)
PLASMA SCRAPE-OFF LAYER
Magnetic- and material-limiter discharges in Tokapole II, 14:53975 (D;US)
PLASMA SHEET
Broadband electrostatic waves as a consequence of magnetotail reconnection, 14:53625 (RA;FR)
PLASMA SWITCHES
Current channel migration and magnetic field penetration in a perfectly conducting plasma with emitting, conducting boundaries, 14:53981 (J;US)
Simulation of the switching performance of an optically triggered pseudo-spark thyratron, 14:52958 (J;US)
PLASMA WAVES
Effect of wave localization on plasma instabilities, 14:53970 (D;US)
On the existence and stability of intermediate shocks, 14:53588 (RA;FR)
Periodic traveling waves bifurcating from multihumped vlasov equilibria, 14:53978 (J;US)
Production of very energetic electrons in a discrete aurora. Technical report, 14:53619 (R;US)
PLASMATRONS
Potential applications of an electron cyclotron resonance multicusp plasma source, 14:54000 (R;US)
PLASMOIDS
Magnetotail reconnection, MHD theory and simulations, 14:53624 (RA;FR)
PLATES (FUEL)
See FUEL PLATES
PLATING
Minimization of chromium-contaminated wastewater at a plating facility in the Eastern United States, 14:53139 (R;US)
PLATINUM
Full-potential linear augmented–Slater-type-orbital method, 14:52589 (J;US)
PLESIOTHERAPY

PLUMES
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 3, Appendix E, Water spray test data, 14:53201 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 6, Appendix H, Selected still photographs, 14:53203 (R;US)

Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 2, Appendices A–D, 14:53200 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 5, Appendix G, Aerosol measurements, 14:53202 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Volume 1, Detailed report, 14:53199 (R;US)
Effectiveness of water spray mitigation systems for accidental releases of hydrogen fluoride: Summary report, 14:53198 (R;US)
Investigation of two features of continuously released heavy gas plumes. Report for September 1986-December 1988, 14:53161 (R;GB)

PLUTONIC ROCKS
See also GRANITES
Characterizing plutonic rock sites for nuclear fuel waste disposal, 14:51823 (J;US)

PLUTONIUM
A DOE/DP multisite approach to safeguards integration with facility operations, 14:51928 (J;US)
A comparison of conventional and prototype nondestructive measurements on molten salt extraction residues, 14:51921 (J;US)
A nondestructive method based on gamma spectrometry for the measurements of plutonium hold-up or plutonium wastes, 14:51906 (J;US)
Analysis of a nuclear material accountancy exercise carried out on mixed-oxide fuel fabrication at Windscale Nuclear Laboratories, 14:51932 (J;US)
Design of an error-free nondestructive plutonium assay facility, 14:51891 (J;US)
Development of a generic computerized nuclear material accountability system, 14:51929 (J;US)
Evaluation of the neutron self-interrogation approach for assay of plutonium in high materials, 14:51908 (J;US)
Experience of developing an integrated nondestructive assay system, 14:51892 (J;US)
Material accountancy system at a new automated mixed-oxide facility: PFPF, 14:51930 (J;US)
Plutonium NDA by thermal fluxmetry, 14:51905 (J;US)
Plutonium assay of large waste burial containers at the Pacific Northwest Laboratory, 14:51903 (J;US)
Prototype fast neutron counter for the assay of impure plutonium, 14:51910 (J;US)
Sources of measurement error in plutonium solids isotopic assay measurements, 14:51920 (J;US)
Transmission-corrected x-ray fluorescence analysis of uranium and plutonium solutions using a dual transmission source, 14:51919 (J;US)
Use of process data to reach international safeguards conclusions, 14:51911 (J;US)
Validation studies performed with mixed Pu + U aqueous critical experiments in annular geometry, 14:51873 (J;US)

PLUTONIUM 236 TARGET
^{236}Pu neutron-induced fission cross section, 14:53803 (RA;SU;In Russian)

PLUTONIUM 239
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)
Study of a dosimetric methodology for plutonium by means of radiotonicological analysis in urine, 14:53884 (R;BR;In Portuguese)

PLUTONIUM 239 TARGET
Character of ν-bar$_p$ dependence on excitation energy and spins of fissile nuclei, 14:53807 (RA;SU;In Russian)
Constants of delayed neutrons, 14:53798 (RA;SU;In Russian)
Determination of the cross sections of delayed neutron production at microtron M-30, 14:53808 (RA;SU;In Russian)
Measurement of transuranium element fission cross section on spectrometer of delayed neutrons in lead, 14:53801 (RA;SU;In Russian)
Prompt neutron spectra of ^{233}U, ^{235}U, ^{239}Pu, ^{252}Cf fission in the energy range of 0.01-12 MeV, 14:53812 (RA;SU;In Russian)
Revised results of absolute ^{239}Pu(n,f) measurements at 4.9 MeV, 8.654 MeV, 14.7 MeV and 18.8 MeV neutron energy, 14:53816 (RA;SU)

PLUTONIUM 241 TARGET
Character of ν-bar$_p$ dependence on excitation energy and spins of fissile nuclei, 14:53807 (RA;SU;In Russian)
Constants of delayed neutrons, 14:53798 (RA;SU;In Russian)
Measurement of transuranium element fission cross section on spectrometer of delayed neutrons in lead, 14:53801 (RA;SU;In Russian)

PLUTONIUM NITRATES
Criticality experiments with mixed plutonium-uranium nitrate solution at plutonium fractions of 0.2, 0.5, and 1.0 in annular cylindrical geometry, 14:51872 (J;US)

PNA

Connective Tissue
Complex clinico-biochemical assessment of development of delayed radiation injuries of connective tissue, 14:53467 (RA;SU;In Russian)

Diagnosis
Ultrasonic examination of patients with delayed radiation injuries, 14:53389 (RA;SU;In Russian)
X-ray diagnosis of intestinal radiation injuries developed after radiation treatment of cervix uteri carcinoma, 14:53388 (RA;SU;In Russian)

Edema
Immune indices and common protein in interstitial fluid as evaluation of treatment effect of patients with secondary (radiation) edema of limbs using laser puncture, 14:53483 (RA;SU;In Russian)
Lazer puncture in combined treatment of secondary (radiation) edema of upper limbs, 14:53481 (RA;SU;In Russian)

Fistulae
Treatment of rectovaginal fistulae following radiation treatment of uterine and cervix uteri carcinoma, 14:53461 (RA;SU;In Russian)

Forecasting
Forecasting of radiation response and complications in radiation treatment of minor pelvis organs, 14:53398 (RA;SU;In Russian)
Modern feasibilities of radiation injuries forecasting in patients with cervix uteri carcinoma, 14:53394 (RA;SU;In Russian)

Gastrointestinal Tract
Radiation injuries of gastrointestinal in patients with Hogdkin disease, 14:53488 (RA;SU;In Russian)

Head
Laser therapy in treatment of radiation injuries in children with malignant tumors of head and neck, 14:53485 (RA;SU;In Russian)

Hyperglycemia
Hyperglycemia in complex therapy of postirradiation recurrences and complications in case of cervix uteri carcinoma, 14:53395 (RA;SU;In Russian)

Large Intestine
Treatment results of colon radiation ulcers, 14:53479 (RA;SU;In Russian)
Use of cozilat preparation as enteral nutrition for patients with late radiation injuries of colon, 14:53478 (RA;SU;In Russian)

Limbs
Lazer puncture in combined treatment of secondary (radiation) edema of upper limbs, 14:53481 (RA;SU;In Russian)

Lungs
Delayed lung radiation injuries following radiation treatment of mammary gland cancer, 14:53464 (RA;SU;In Russian)

Medical Examinations
Medical and sanitary measures taken to deal with the consequences of the Chernobyl accident, 14:52303 (RA;XA)

Neck
Laser therapy in treatment of radiation injuries in children with malignant tumors of head and neck, 14:53485 (RA;SU;In Russian)

Nervous System Diseases
Reflex therapy in treatment of secondary (radiation) neurologic disorders, 14:53482 (RA;SU;In Russian)

Plastic Surgery
Microsurgical autoplastictransplantation of greater omentum for plasty of radiation injuries of integmentary tissues, 14:53475 (RA;SU;In Russian)

Post-Irradiation Therapy
Treatment of delayed radiation injuries of lungs, 14:53476 (RA;SU;In Russian)

Skeleton
Angiogenic periostosis of crus bones following radiotherapy of skin melanoma, 14:53470 (RA;SU;In Russian)

Skin
Local radiation injuries, 14:53474 (RA;SU;In Russian)

Therapy
Medical care during the radiation accident (^{137}Cs) in Brazil, 1987, 14:53437 (RA;XA)
Rehabilitation of victims of acute radiation sickness, 14:53434 (RA;XA)
Transplantation of bone marrow in victims of the Chernobyl accident, 14:53433 (RA;XA)

Thyroid
Comparative assessment of effect of various types of radiation treatment on thyroid function in patients with pharynx neoplasm, 14:53396 (RA;SU;In Russian)

Transplants
Microsurgical autoplastictransplantation of greater omentum for plasty of radiation injuries of integmentary tissues, 14:53475 (RA;SU;In Russian)

Ulcers
Experience on electropuncture application in treatment of late radiation ulcers, 14:53484 (RA;SU;In Russian)
Radiation injuries of exterior genital organs, 14:53486 (RA;SU;In Russian)
Treatment of radiation ulcers of skin and adjacent soft tissues in controlled abactrial medium, 14:53473 (RA;SU;In Russian)

Vertebrae
Radiation injuries of vertebrae in esophagus cancer treatment, 14:53471 (RA;SU;In Russian)

RADIATION MONITORING
Organizational, methodological and information aspects of the mass individual dosimetric surveys carried out in contaminated areas following the Chernobyl accident, 14:52321 (RA;XA)

Recommendations for a revision of the Guideline on Emission and Environmental Impact Monitoring of Nuclear Facilities. Statement of the Working Group on Environmental Monitoring, 14:53238 (R;DE;In German)
Remote radiation monitoring in critical experiments, 14:52888 (J;US)

RADIATION MONITORS
See also NEUTRON MONITORS
Diode calibration manual, 14:53208 (R;US)

RADIATION PROTECTION
Development of intervention levels for the protection of the public in the event of a major nuclear accident - Past, present and future, 14:53878 (RA;XA)
Protective measures to reduce population exposure doses and effectiveness of these measures, 14:52314 (RA;XA)

RADIATION SAFETY
See RADIATION PROTECTION

RADIATION SOURCES
See also LIGHT SOURCES
SYNCHROTRON RADIATION SOURCES
X-RAY SOURCES
Site characterization for radon source potential, 14:53245 (R;US)

RADIATION SYNDROME
Acute effects of radiation exposure following the Chernobyl accident: Immediate results of radiation sickness and outcome of treatment, 14:53432 (RA;XA)

RADICALS
Free radicals in the earth's atmosphere: Measurement and interpretation, 14:53145 (RA;US)

RADIOACTIVE AEROSOLS
Environmental radioactivity monitoring after Chernobyl in Italy, 14:53233 (RA;IT;In Italian)
Particle deposition in human and canine tracheobronchial casts: Progress report, 14:53546 (R;US)

RADIOACTIVE BIOLOGICAL WASTES
See RADIOACTIVE WASTES

RADIOACTIVE EFFLUENTS
Recommendations for a revision of the Guideline on Emission and Environmental Impact Monitoring of Nuclear Facilities. Statement of the Working Group on Environmental Monitoring, 14:53238 (R;DE;In German)

RADIOACTIVE GASEOUS WASTES
See GASEOUS WASTES
RADIOACTIVE WASTES

RADIOACTIVE MATERIALS
See also FISSION PRODUCTS
RADIOACTIVE WASTES
Automating special nuclear materials tracking, 14:51943 (J;US)
Contamination control: A balance between containment design and good practice in operation, 14:53540 (R;US)
Development of strain gauge evaluation channels for use in dynamic testing of shipping casks, 14:51749 (J;US)
Draft remedial investigation/feasibility study work plan for the 300-FF-5 operable unit, Hanford Site, Richland, Washington, 14:51757 (R;US)
System reliability, 14:51876 (R;US)

RADIOACTIVE PARTICULATES
See PARTICLES
RADIOACTIVE AEROSOLS

RADIOACTIVE WASTE DISPOSAL

Cements
Chemistry and expansion of limestone - Portland cement mortars exposed to sulphate containing solutions, 14:52659 (R;GB)

Containment Systems
Assessment of an engineered barrier system and design of waste packages, 14:51843 (J;US)

Coordinated Research Programs
Field studies, laboratory experiments, and modeling investigations in fractured media, 14:51850 (J;US)
Foreign cooperative technology development and transfer, 14:51848 (J;US)
The INTRAVAL project: An international effort toward validation of geospheric transport models used in performance assessment, 14:51810 (J;US)

Evaluation
Statement of Dr. Frank L. Parker, Chairman, Board on Radioactive Waste Management, National Academy of Sciences, accompanied by Dr. Peter B. Myers, Staff Director, 14:51791 (BA;US)
Statement of Hugh L. Thompson, Jr. Director, Office of Nuclear Material Safety and Safeguards, US Nuclear Regulatory Commission, accompanied by Robert E. Browning, Director, Division of High Level Waste Management; and Richard E. Cunningham, Director, Division of Fuel Cycle, Medical, Academic, and Commercial Use Safety, 14:51790 (BA;US)

Iaea Safeguards
Operator experiences with international safeguards in the back end of the fuel cycle-geared to economic efficiency, 14:51881 (J;US)

Licensing
Systems approach to developing and implementing an HLW licensing process, 14:51814 (J;US)

Monitoring
Instrumentation development, 14:51851 (J;US)

Operating Cost
Theory and evidence of economies of scale in the development of waste management systems, 14:52960 (R;US)

Packaging
Assessment of an engineered barrier system and design of waste packages, 14:51843 (J;US)

Quality Assurance
Quality assurance requirements for high-level waste form production, 14:51853 (J;US)
Use of performance assessments to generate a repository Q list, 14:51799 (J;US)

Radionuclide Migration
Active geothermal systems as natural analogs of HLW repositories, 14:51828 (J;US)
Assessment of radionuclide retardation, 14:51845 (J;US)
Field studies, laboratory experiments, and modeling investigations in fractured media, 14:51850 (J;US)
International Alligator Rivers Analog Project, 14:51811 (J;US)
Mass transfer and transport in geologic repositories-analytical studies and applications, 14:51869 (J;US)
Natural radionuclides in ground waters and cores, 14:51827 (J;US)
Performance assessments for the safety analysis report, 14:51866 (J;US)
The INTRAVAL project: An international effort toward validation of geospheric transport models used in performance assessment, 14:51810 (J;US)
The role of natural analogs in performance assessment, 14:51809 (J;US)
Tracer travel time and model validation, 14:51808 (J;US)
Transient diffusion from a waste solid into fractured porous rock, 14:51813 (J;US)
Uranium deposits in sandstones as analogs for spent fuel rod disposal, 14:51812 (J;US)

S Codes
Comparison of source-term calculations using the AREST and SYVAC-vault models, 14:51870 (J;US)

Safety
Current issues in postclosure performance assessment, 14:51871 (J;US)
Performance assessment methodologies for the analysis of high-level nuclear waste repositories, 14:51868 (J;US)
Performance assessments for the safety analysis report, 14:51866 (J;US)
The DOE approach to preclosure repository safety assessment, 14:51867 (J;US)
Use of performance assessments to generate a repository Q list, 14:51799 (J;US)

Salt Deposits
Statement of J.O. Neff, Manager, Salt Repository Project Office, Department of Energy, 14:51792 (BA;US)

Site Characterization
Statement of Ben C. Rusche, Director, Office of Civilian Radioactive Waste Management, Department of Energy, 14:51793 (BA;US)

Site Selection
A conceptual design for a nuclear waste repository at the Yucca Mountain site, 14:51840 (J;US)
A top-level strategy for postclosure performance assessment of Yucca Mountain, 14:51842 (J;US)
Assessment of radionuclide retardation, 14:51845 (J;US)
Assessment of seismic hazards at Yucca Mountain, 14:51846 (J;US)
Assessment of worker and nonworker radiological safety of a repository, 14:51847 (J;US)
Characterization of the subregional groundwater flow system of Yucca Mountain and vicinity, Nevada-California, 14:51837 (J;US)
Characterization program for the Gorleben site in Germany, 14:51826 (J;US)
Characterizing plutonic rock sites for nuclear fuel waste disposal, 14:51823 (J;US)
Conceptual model of flow and solute transport in the unsaturated zone beneath Yucca Mountain, Nevada, 14:51838 (J;US)
Deriving a site characterization program from applicable regulations, 14:51841 (J;US)
Field studies, laboratory experiments, and modeling investigations in fractured media, 14:51850 (J;US)
HLW [high-level waste] site characterization plan in Switzerland, 14:51825 (J;US)
Implementation of 10CFR960 - a regulatory perspective, 14:51820 (J;US)
Mineralogic, petrologic, and geochemical studies of the volcanic rocks at Yucca Mountain, Nevada, for high-level waste disposal, 14:51839 (J;US)
Neotectonics and volcanism at Yucca Mountain and vicinity, Nevada, 14:51836 (J;US)
Overview of the DOE [Department of Energy] site characterization program, 14:51833 (J;US)
Preliminary estimates of groundwater travel time at Yucca Mountain, 14:51844 (J;US)
Site characterization activities at Stripa and other Swedish projects, 14:51824 (J;US)
Site characterization and its role in repository licensing, 14:51819 (J;US)
Site characterization at Yucca Mountain, 14:51834 (J;US)
Site characterization technology, 14:51849 (J;US)
Siting a low-level waste facility in California: A success story, 14:51818 (J;US)
Stratigraphic and structural framework of Yucca Mountain, Nevada, 14:51835 (J;US)
Technology transfer from the US DOE/AECL cooperative project, 14:51822 (J;US)
US strategy for evaluating the Yucca Mountain, Nevada site, 14:51821 (J;US)

Source Terms
Comparison of source-term calculations using the AREST and SYVAC-vault models, 14:51870 (J;US)

Systems Analysis
Systems approach to developing and implementing an HLW licensing process, 14:51814 (J;US)

Technology Transfer
Instrumentation development, 14:51851 (J;US)
Technology transfer from the US DOE/AECL cooperative project, 14:51822 (J;US)

Water Pollution
Superfund Record of Decision (EPA Region 6): United Nuclear Corporation, Mckinley County, New Mexico, ground-water operable unit (first remedial action) September 1988, 14:51770 (R;US)

a Codes
Comparison of source-term calculations using the AREST and SYVAC-vault models, 14:51870 (J;US)

RADIOACTIVE WASTE FACILITIES
See also ASSE SALT MINE
WIPP
Application and results of a reinjection technique for hydrothermal experiments in Dickson autoclaves, 14:51783 (R;US)
Draft remedial investigation/feasibility study work plan for the 300-FF-5 operable unit, Hanford Site, Richland, Washington, 14:51757 (R;US)
Evolution of pH in a radwaste repository. Leaching of modified cements and reactions with groundwater, 14:51752 (R;GB)
Inhibition of nuclear waste solutions containing multiple aggressive anions, 14:51788 (B;US)
Long-term prediction of corrosion of stainless steel nuclear waste canisters, 14:52569 (R;GB)
Nevada test site low-level and mixed waste repository design in the unsaturated zone, 14:51754 (R;US)

RADIOACTIVE WASTE MANAGEMENT
Theory and evidence of economies of scale in the development of waste management systems, 14:52960 (R;US)

RADIOACTIVE WASTE PROCESSING
A nondestructive method based on gamma spectrometry for the measurements of plutonium hold-up or plutonium wastes, 14:51906 (J;US)
Defense Waste Processing Facility software implementation, 14:51786 (R;US)
Evaluation of the neutron self-interrogation approach for assay of plutonium in high materials, 14:51908 (J;US)
Human engineering considerations in the design of New Virginia Power Radwaste facilities, 14:52282 (J;US)
Human engineering considerations in the design of major radwaste systems, 14:51804 (J;US)
Human engineering in mobile radwaste systems, 14:52283 (J;US)
Operator experiences with international safeguards in the back end of the fuel cycle-geared to economic efficiency, 14:51881 (J;US)
Recent advances in segmented gamma scanner analysis, 14:51909 (J;US)

RADIOACTIVE WASTE STORAGE
See also MONITORED RETRIEVABLE STORAGE
A study of the hydrothermal stability of copper for use as a container material for nuclear waste, 14:52874 (R;US)
Statement of Ben C. Rusche, Director, Office of Civilian Radioactive Waste Management, Department of Energy, 14:52396 (BA;US)
Statement of Dr. Frank L. Parker, Chairman, Board on Radioactive Waste Management, National Academy of Sciences, accompanied by Dr. Peter B. Myers, Staff Director, 14:51791 (BA;US)
Statement of Hugh L. Thompson, Jr. Director, Office of Nuclear Material Safety and Safeguards, US Nuclear Regulatory Commission, accompanied by Robert E. Browning, Director, Division of High Level Waste Management; and Richard E. Cunningham, Director, Division of Fuel Cycle, Medical, Academic, and Commercial Use Safety, 14:51790 (BA;US)
Techniques of treatment or conditioning for waste arising from ^{131}I production, 14:51763 (R;BR)

RADIOACTIVE WASTES
See also ALPHA-BEARING WASTES
HIGH-LEVEL RADIOACTIVE WASTES
INTERMEDIATE-LEVEL RADIOACTIVE WASTES
LOW-LEVEL RADIOACTIVE WASTES
RADIOACTIVE EFFLUENTS
A review of remediation contracting practices, 14:51863 (R;US)
Assessment of environmental conditions at the Rocky Flats Plant, Golden, Colorado, 14:53237 (R;US)
Defense Waste Processing Facility software implementation, 14:51786 (R;US)
In situ vitrification of mixed wastes, 14:51800 (J;US)
Organic diagenesis in commercial nuclear wastes, 14:51832 (J;US)
Overview and current status of the US radioactive-waste management program, 14:51794 (J;US)

RADIOAPPLICATORS
See RADIATION SOURCES

RADIOBIOLOGICAL EFFECTS
See BIOLOGICAL RADIATION EFFECTS

RADIOBIOLOGY
Proceedings of the third Japan-US workshop P-133 on tritium radiobiology and health physics. 9. international symposium of Radiation Biology Center, 14:53497 (R;JP)

RADIOCARBON DATING
See CARBON 14
ISOTOPE DATING

RADIOCHEMICAL ANALYSIS
Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988, 14:52711 (R;XA)

RADIOCHEMISTRY
A code for the calculation of self-absorption fractions of photons, 14:52746 (J;US)
NAADA: A general-purpose PC-based NAA [neutron activation analysis] routine for the novice researcher, 14:52756 (J;US)
Progress in high-speed activation analysis, 14:52742 (J;US)
Radiochemical neutron activation analysis: Status in chemical analysis, 14:52738 (J;US)
Rapid radiochemical neutron activation analysis - status and future, 14:52741 (J;US)

RADIODERMATITIS
Modification of radiation skin injuries resulted from fast neutrons irradiation, 14:53442 (RA;SU;In Russian)

RADIODIAGNOSIS (RADIONUCLIDES)
See DIAGNOSIS
NUCLEAR MEDICINE

RADIOECOLOGICAL CONCENTRATION
Papers presented at the intensive seminar on tree rings, 14:53240 (R;JP;In Japanese)

RADIOFREQUENCY SYSTEMS
See RF SYSTEMS

RADIOGRAPHY (BIOMEDICAL)

RADIOISOTOPE SCANNERS
High-resolution PET [positron emission tomography] for medical science studies, 14:53414 (R;US)

RADIOISOTOPE SCANNING
Current SGS [segmented gamma-ray scanner] technology, 14:51900 (J;US)

RADIOISOTOPE-LABELLED DRUGS
See RADIOPHARMACEUTICALS

RADIOISOTOPES
Environmental radioactivity from natural, industrial, and military sources: Third edition, 14:53429 (R;US)
Nuclear structure from radioactive decay: Annual progress report, 14:53790 (R;US)
Rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, 14:52716 (RA;XA)
Stripping analysis: an electroanalytical technique or a technique applicable for others sectors of instrumental analysis, 14:52724 (R;BR)

RADIOLOGICAL PERSONNEL
Radiation burdens on patients and medical personnel durng investigations on X-ray computerized tomographe, 14:53354 (RA;SU;In Russian)

RADIOLOGICAL PROTECTION
See RADIATION PROTECTION

RADIOMETRIC ANALYSIS
Analytical procedures for the determination of strontium radionuclides in environmental materials. Aquatic environment protection: analytical methods, 14:52735 (R;GB)

RADIOMETRIC SURVEYS
Fission track and TL analysis, 14:53219 (RA;DE;In German)

RADIONUCLIDE DISTRIBUTIONS
See RADIONUCLIDE KINETICS

RADIONUCLIDE KINETICS
Monitoring of internal exposure of the population in regions close to the Chernobyl nuclear power plant, 14:52317 (RA;XA)
Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988, 14:52711 (R;XA)
Tritium absorption through various types of trauma in the skin of hairless mice and its prevention, 14:53509 (RA;JP)

RADIONUCLIDE METABOLISM
See RADIONUCLIDE KINETICS

RADIONUCLIDE MIGRATION
Analysis of the wind data and estimation of the resultant doses from the supersonic anemometer. A comparison study of the supersonic and propeller wind data, 14:53206 (R;JP)
Development of a three-dimensional local scale atmospheric model with turbulence closure model, 14:53207 (R;JP)
International Alligator Rivers Analog Project, 14:51811 (J;US)
Possible approaches for the development of rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, 14:52715 (RA;XA)
Report of the consultants' meeting on rapid instrumental and separation methods for monitoring radionuclides in food and environmental samples, Vienna, 5-9 September 1988, 14:52711 (R;XA)
Tracer travel time and model validation, 14:51808 (J;US)
Uranium deposits in sandstones as analogs for spent fuel rod disposal, 14:51812 (J;US)

RADIONUCLIDE TRANSFER (IN ENVIRONMENT)
See RADIONUCLIDE MIGRATION

RADIONUCLIDE TRANSFER (IN ORGANISMS)
See RADIONUCLIDE KINETICS

RADIONUCLIDE TURNOVER
See RADIONUCLIDE KINETICS

RADIONUCLIDES
See RADIOISOTOPES

RADIOPHARMACEUTICALS
Dosimetry of radiopharmaceuticals, 14:53885 (RA;SU;In Russian)
Improving cancer treatment with cyclotron produced radionuclides: Progress report: Retrospective summary, 1958–1988, 14:53318 (R;US)

RADIOPRESERVATION
Food irradiation. Hearing before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, One Hundredth Congress, First Session on H.R. 956, June 19, 1987, 14:53426 (B;US)

RADIOPROTECTIVE SUBSTANCES
Method for protecting bone marrow against chemotherapeutic drugs and radiation therapy using transforming growth factor beta 1, 14:53411 (P;US)

RADIOSTERILIZATION
Studies of irradiation sterilization for single infusion device, 14:53420 (R;CN;In Chinese)

RADIOSURGERY
See RADIOTHERAPY
SURGERY

RADIOTHERAPY
Comparison of immunoregulators number and their functioning in case of lymphogranulomatosis. Modifying effect of component of complex treatment and other factors on immunoregulatory function, 14:53404 (RA;SU;In Russian)

Delayed Radiation Effects
Assessment of severity of delayed skin radiation injuries following acute local irradiation according to dosimetric data, 14:53458 (RA;SU;In Russian)
Characteristic of frequency of delayed injuries following radiotherapy according to native and foreign data, 14:53445 (RA;SU;In Russian)
Delayed injuries of healthy tissues in case of various types of conservative treatment of neoplasms of nasal, oral and pharyngeal, 14:53443 (RA;SU;In Russian)

Delayed local complications following radiotherapy of disseminated pharynx neoplasm and their treatment, 14:53453 (RA;SU;In Russian)
Delayed radiation injuries following repeated irradiation of pelvis and femur in the regime of medium fractionation, 14:53456 (RA;SU;In Russian)
Delayed radiation injuries in oncogynecology, 14:53441 (RA;SU;In Russian)
Delayed radiation injuries of maxillofacial area, 14:53444 (RA;SU;In Russian)
Delayed radiation pericarditis, 14:53462 (RA;SU;In Russian)
Diagnosis and treatment of local delayed radiation injuries. Summaries of reports, 14:53440 (R;SU;In Russian)
Local radiation injuries, 14:53474 (RA;SU;In Russian)
Radiation complications following Ewing sarcoma of long tubular bones in children and adolescents, 14:53457 (RA;SU;In Russian)
Use of biological isoeffective dose concept to prevent delayed radiation injuries, 14:53390 (RA;SU;In Russian)

Dose Rates
Intraoperative radiation therapy: Characterization and application. Master's thesis, 14:53315 (R;US)

Dosimetry
Assessment of severity of delayed skin radiation injuries following acute local irradiation according to dosimetric data, 14:53458 (RA;SU;In Russian)

Immunity
Effect of hyperglycenia on the function of immunoregulatory cells and production of interleukine-2, 14:53403 (RA;SU;In Russian)
Immunocorrection in radiation and combined treatment of neoplasms, 14:53405 (RA;SU;In Russian)

Integral Doses
Use of biological isoeffective dose concept to prevent delayed radiation injuries, 14:53390 (RA;SU;In Russian)

Local Radiation Effects
Assurance role of radiation treatment quality in prophylaxis of local radiation injuries, 14:53392 (RA;SU;In Russian)

Neoplasms
Efficient treatment plan of neoplasms of some localization as a possibility of decreasing radiation injuries and complications, 14:53393 (RA;SU;In Russian)

Optimization
Efficient treatment plan of neoplasms of some localization as a possibility of decreasing radiation injuries and complications, 14:53393 (RA;SU;In Russian)
Results of radiation treatment of patients with cervix uteri carcinoma of 2-3 stage at the Curietron and Selectron devices, 14:53397 (RA;SU;In Russian)

Planning
Forecasting of early and delayed local complications in radiation treatment of neoplasms, 14:53391 (RA;SU;In Russian)

Quality Assurance
Assurance role of radiation treatment quality in prophylaxis of local radiation injuries, 14:53392 (RA;SU;In Russian)

Radiation Injuries
Local radiation injuries and their classification, 14:53446 (RA;SU;In Russian)

Radiopharmaceuticals
Needless method of intratumoral injection of radiopharmaceuticals of treatment purpose, 14:53319 (RA;SU;In Russian)

Radioprotective Substances
Method for protecting bone marrow against chemotherapeutic drugs and radiation therapy using transforming growth factor beta 1, 14:53411 (P;US)

Side Effects
Analysis of lung injuries following radiation treatment of lung cancer, 14:53451 (RA;SU;In Russian)
Angiogenic periostosis of crus bones following radiotherapy of skin melanoma, 14:53470 (RA;SU;In Russian)
Assessment of factors change of rheovasogram before and after conservative treatment in patients with secondary (radiation) edema of upper limbs, 14:53459 (RA;SU;In Russian)
Characteristic of frequency of delayed injuries following radiotherapy according to native and foreign data, 14:53445 (RA;SU;In Russian)
Comparative assessment of effect of various types of radiation treatment on thyroid function in patients with pharynx neoplasm, 14:53396 (RA;SU;In Russian)
Complex clinico-biochemical assessment of development of delayed radiation injuries of connective tissue, 14:53467 (RA;SU;In Russian)
Delayed injuries of healthy tissues in case of various types of conservative treatment of neoplasms of nasal, oral and pharyngeal, 14:53443 (RA;SU;In Russian)
Delayed lung radiation injuries following radiation treatment of mammary gland cancer, 14:53464 (RA;SU;In Russian)
Delayed radiation injuries in oncogynecology, 14:53441 (RA;SU;In Russian)
Delayed radiation injuries of maxillofacial area, 14:53444 (RA;SU;In Russian)
Delayed radiation intrapelvic fibrosis, 14:53449 (RA;SU;In Russian)
Delayed radiation pericarditis, 14:53462 (RA;SU;In Russian)
Dimexide (dmso) for prophylaxis and treatment of local radiation injuries, 14:53472 (RA;SU;In Russian)
Dynamics of rheological blood properties in patients with radiation edema of upper limbs in the course of conservative treatment, 14:53466 (RA;SU;In Russian)
Examination of nervous-muscular system and peripheral blood circulation in patients radically treated in case of mammary gland cancer, 14:53465 (RA;SU;In Russian)
Experience on electropuncture application in treatment of late radiation ulcers, 14:53484 (RA;SU;In Russian)
Forecasting of early and delayed local complications in radiation treatment of neoplasms, 14:53391 (RA;SU;In Russian)
Forecasting of radiation response and complications in radiation treatment of minor pelvis organs, 14:53398 (RA;SU;In Russian)
Functional state of cardiovascular system at delayed periods following radio- and chemotherapy, 14:53460 (RA;SU;In Russian)
Hyperglycemia in complex therapy of postirradiation recurrences and complications in case of cervix uteri carcinoma, 14:53395 (RA;SU;In Russian)
Immune indices and common protein in interstitial fluid as evaluation of treatment effect of patients with secondary (radiation) edema of limbs using laser puncture, 14:53483 (RA;SU;In Russian)
Laser therapy in treatment of radiation injuries in children with malignant tumors of head and neck, 14:53485 (RA;SU;In Russian)
Lazer puncture in combined treatment of secondary (radiation) edema of upper limbs, 14:53481 (RA;SU;In Russian)
Local radiation injuries, 14:53474 (RA;SU;In Russian)
Local radiation injuries and their classification, 14:53446 (RA;SU;In Russian)
Microsurgical autoplastictransplantation of greater omentum for plasty of radiation injuries of integmentary tissues, 14:53475 (RA;SU;In Russian)
Modern feasibilities of radiation injuries forecasting in patients with cervix uteri carcinoma, 14:53394 (RA;SU;In Russian)
Modification of radiation skin injuries resulted from fast neutrons irradiation, 14:53442 (RA;SU;In Russian)
Pecularities of radiation response and complications in radiation treatment of cervix uteri carcinoma using large dose fractionation at Agat-B device, 14:53447 (RA;SU;In Russian)
Peculiarities of course and treatment of radiation cystitis in the process of concominatant radiotherapy including intracavitary gamma-therapy at Agat-B unit in patients with cevrix uteri carcinoma, 14:53480 (RA;SU;In Russian)
Prophylaxis of severe rectum radiation injuries in patients with cervix uteri carcinoma, 14:53448 (RA;SU;In Russian)
Radiation complications following Ewing sarcoma of long tubular bones in children and adolescents, 14:53457 (RA;SU;In Russian)
Radiation complications following interstitial and combined radiotherapy of tongue and oral cavity neoplasm, 14:53452 (RA;SU;In Russian)

Radiation fibroses and pulmonitises in patients with Hodgkin's disease of 3-d stage in various fractionation regimes, 14:53463 (RA;SU;In Russian)
Radiation injuries of exterior genital organs, 14:53486 (RA;SU;In Russian)
Radiation injuries of gastrointestinal in patients with Hogdkin disease, 14:53488 (RA;SU;In Russian)
Radiation injuries of small pelvs organs and tissues in treatment of vagina rhabdomyosarcomas in children, 14:53450 (RA;SU;In Russian)
Radiation injuries of the pharynx, 14:53454 (RA;SU;In Russian)
Radiation injuries of vertebrae in esophagus cancer treatment, 14:53471 (RA;SU;In Russian)
Radiodiagnosis of lymph flow disturbances in patients with delayed radiation injuries of soft tissues, 14:53468 (RA;SU;In Russian)
Radiodiagnosis of radiation injuries of limb bones in adults, 14:53469 (RA;SU;In Russian)
Reflex therapy in treatment of secondary (radiation) neurologic disorders, 14:53482 (RA;SU;In Russian)
Treatment of delayed radiation injuries of lungs, 14:53476 (RA;SU;In Russian)
Treatment of operative wounds because of breast cancer with preoperative radiotherapy, 14:53477 (RA;SU;In Russian)
Treatment of radiation ulcers of skin and adjacent soft tissues in controlled abactrial medium, 14:53473 (RA;SU;In Russian)
Treatment of rectovaginal fistulae following radiation treatment of uterine and cervix uteri carcinoma, 14:53461 (RA;SU;In Russian)
Treatment results of colon radiation ulcers, 14:53479 (RA;SU;In Russian)
Ultrasonic examination of patients with delayed radiation injuries, 14:53389 (RA;SU;In Russian)
Use of cozilat preparation as enteral nutrition for patients with late radiation injuries of colon, 14:53478 (RA;SU;In Russian)
X-ray diagnosis of intestinal radiation injuries developed after radiation treatment of cervix uteri carcinoma, 14:53388 (RA;SU;In Russian)

RADIOTHERMOLUMINESCENCE
Radiothermoluminescence studies of polymer solids. Final report, 1 August 1985-31 July 1988, 14:52637 (R;US)

RADIUM 226
Preliminary site survey report for the former Elza Gate warehouse area, Oak Ridge, Tennessee, 14:53244 (R;US)

RADIUM D
See LEAD 210

RADIUM F
See POLONIUM 210

RADON
Site characterization for radon source potential, 14:53245 (R;US)

RAIL TRANSPORT
Control of railroads and operating control, 14:52460 (RA;JP;In Japanese)
Light rail transit: New system successes at affordable prices. Special report, 14:52463 (R;US)
Rail replacement and maintenance management. Transportation research record, 14:52465 (R;US)

RAILGUN ACCELERATORS
Analytic solutions to dynamic equations of plasma armature railguns, 14:52988 (J;US)
Electrothermal accelerators, 14:54020 (J;US)
Fabrication issues and technology development for HELEOS, 14:52986 (J;US)
Plasma armature formation in high-pressure, high-velocity hydrogen, 14:54025 (J;US)
Plasma behavior in the boundary layer near a railgun surface, 14:52981 (J;US)
Railgun rail gouging by hypervelocity sliding contact, 14:54017 (J;US)
Starfire, 14:52982 (J;US)
Structural consequences of railgun augmentation, 14:52985 (J;US)
Use of a two-stage light-gas gun as an injector for electromagnetic railguns, 14:52987 (J;US)
Why plasma armature railguns don't work (and what can be done about it), 14:52983 (J;US)

RAILWAYS
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 2. Final report, 14:53567 (R;US)
Noise-reduction effectiveness of resilient rail fasteners on steel solid web stringer elevated structures. Volume 1. Final report, 14:53566 (R;US)
Rail replacement and maintenance management. Transportation research record, 14:52465 (R;US)

RANDOM PHASE APPROXIMATION
Second RPA dynamics at finite temperature: time-evolutions of dynamical operators, 14:53921 (R;FR)

RANKINE CYCLE ENGINES
C-CAMP, a Closed Cycle Alkali Metal Power system, 14:52520 (BA;US)

RARE EARTH COMPOUNDS

SALEM-1 REACTOR
Safeguards implementation at US facilities during 1986 and 1987, 14:51942 (J;US)
SALINE ZONE
See OIL SHALES
SALMON
Development of rations for the enhanced survival of salmon: Annual report 1988, 14:52048 (R;US)
SALT DEPOSITS
Stresss measurement in salt strata by means of hydraulic ripping, 14:51761 (R;DE;In German)
SALT TRANSPORT PROCESS
See PYROCHEMICAL REPROCESSING
SALTON SEA GEOTHERMAL FIELD
Rare-earth elements in hot brines (165 to 190°C) from the Salton Sea geothermal field, 14:52130 (J;US)
SAMARIUM
Laser driven photocathode studies for high gradient accelerators, 14:53040 (BA;US)
SAMARIUM 139
Nuclear data sheets for A=139, 14:53780 (J;US)
SAMARIUM OXIDES
High-temperature raman spectroscopy study of crystallization processes of gallium garnet melts, 14:52767 (RA;SU;In Russian)
SAMARIUM SULFIDES
Thermal conductivity of $La_{3-x}R_xS_4$ where R=Sm, Eu, and Yb, 14:52692 (J;US)
SAMPLE PREPARATION
Preparation of special sputtering material for the accelerator ion source, 14:52766 (RA;DE;In German)
SAN FRANCISCO BAY
Evaluation of candidate measures of biological effects for the National Status and Trends Program. Technical memo. February 1987-April 1989 (Final), 14:53265 (R;US)
SAN ONOFRE-2 REACTOR
Demonstration of reliability-centered maintenance: Volume 2: First annual progress report from San Onofre nuclear generating station, 14:52298 (R;US)
SANDIA LABORATORIES
A 100-J tuned laser for ionization of lithium in a PBFA-II ion source, 14:52915 (BA;US)
Starfire, 14:52982 (J;US)
SANDSTONES
Petrophysical properties and network models of gas-bearing reservoir rocks. Annual report, October 1, 1987-November 30, 1988. Technical report, 14:51728 (R;US)
Quasi-static and dynamic mechanical properties of a granite and a sandstone, 14:53574 (R;US)
Systematic procedure for reservoir characterization: Final report, 14:51709 (R;US)
SANITARY LANDFILLS
North Carolina sanitary landfills: Leachate generation, management, and water-quality impacts, 14:53263 (R;US)
Remedial investigation of landfill Pit 8 Lawrence Livermore National Laboratory Site 300, 14:53229 (R;US)
Use of landfill gas as a replacement fuel in a shell boiler. A demonstration at Premier Brands Ltd. Merseyside, 14:52045 (R;GB)
SAPPHIRE
Optical and structural properties of molecular-beam epitaxial GaAs on sapphire, 14:52947 (R;US)
SARCOMAS
Needless method of intratumoral injection of radiopharmaceuticals of treatment purpose, 14:53319 (RA;SU;In Russian)
Roentgenologic peculiarities of osteogeni, 14:53323 (RA;SU;In Russian)
SATELLITES
See also MOON
Initial effects of nuclear weapon x-radiation on the LAMPSHADE orbital debris satellite shield, 14:53114 (R;US)
Microparticle impacts in space: Results from Solar Max and shuttle witness plate inspections, 14:52560 (RA;US)
Realtime tracking system for wide-field-of-view telescope, 14:53117 (R;US)
Sandia Satellite Program summary of operational procedures, 14:52471 (R;US)
SAVANNAH RIVER PLANT
Current SGS [segmented gamma-ray scanner] technology, 14:51900 (J;US)

Defense Waste Processing Facility software implementation, 14:51786 (R;US)
Design of an error-free nondestructive plutonium assay facility, 14:51891 (J;US)
Development of a generic computerized nuclear material accountability system, 14:51929 (J;US)
Experience of developing an integrated nondestructive assay system, 14:51892 (J;US)
Expert robots in nuclear plants, 14:52259 (BA;US)
HyperCard development and implementation at SRS [Savannah River Site], 14:54065 (R;US)
Integrated intelligent systems in advanced reactor control rooms, 14:52257 (R;US)
Large scale process simulation: A case study integrated waste processing flowsheet for SRS [Savannah River Site], 14:51784 (R;US)
NDA for a new facility at SRP, 14:51923 (J;US)
Plant community structure in disturbed and undisturbed forested wetlands, 14:52289 (R;US)
Program for low-level radioactive waste disposal at the Savannah River Site, A U.S. nuclear materials production facility: Revision 1, 14:51758 (R;US)

SEDIMENTATION
Evaluation of gamma lines for NAA, 14:52740 (J;US)
Neutron activation analysis of major, minor, and trace elements in marine sediments, 14:52758 (J;US)
Radionuclides and trace elements in middle Chesapeake Bay sediments, 14:51854 (J;US)

SEDIMENTS
Amphipod bioassay of selected sediments from Sequim Bay, Washington, 14:53273 (R;US)
Biogeochemistry of (210)Pb and (210)Po in fresh waters and sediments. Doctoral thesis, 14:53277 (R;US)
Evaluation of candidate measures of biological effects for the National Status and Trends Program. Technical memo. February 1987-April 1989 (Final), 14:53265 (R;US)
Summary of data on individual organic contaminants in sediments collected during 1984, 1985, 1986, and 1987. Progress report, 14:53168 (R;US)
Summary of selected data on chemical contaminants in sediments collected during 1984, 1985, 1986, and 1987. Technical memo, 14:53176 (R;US)
Thermoluminescence dating of quaternary sediments and paleolithic sites, 14:53222 (RA;DE;In German)

SEISMIC DETECTION
Lg-wave propagation in heterogeneous media. Final report, 15 February 1988-14 February 1989, 14:53128 (R;AU)

SEISMIC WAVES
Lg-wave propagation in heterogeneous media. Final report, 15 February 1988-14 February 1989, 14:53128 (R;AU)
Modeling regional seismic waves from underground nuclear explosion. Report for 17 March 1987-30 March 88, 14:53126 (R;US)

SELENIUM
A combination of radioanalytical and biochemical methods in the investigation of the selenium metabolism, 14:53304 (J;US)
Advance prediction results for selenium measurement by INAA in biological reference materials, 14:53305 (J;US)
Determination of sampling constants for selenium by cyclic INAA, 14:53314 (J;US)
Evaluation of precision and accuracy of selenium measurements in biological materials using neutron activation analysis, 14:53307 (J;US)
Instrumental and preconcentration NAA methods for selenium in biological materials, 14:53311 (J;US)
Molecular neutron activation analysis of selenium metabolites in urine, 14:53306 (J;US)
Neutron activation of selenium and arsenic with or without chemical separation, 14:53309 (J;US)
Nuclear-based methods for the study of selenium, 14:53308 (J;US)

Radiochemical methods for selenium in biological materials, 14:53310 (J;US)
Sample handling and chemical procedures for efficacious trace analysis of urine by neutron activation analysis, 14:52750 (J;US)
Selenium determination in biological material by atomic absorption spectrophotometry in graphite furnace and using vapor generation, 14:52725 (R;BR;In Portuguese)
Selenium determinations for the assessment of sample stability in specimen banking, 14:53312 (J;US)
The use of neutron activation analysis to determine selenium status in the Australian diet, 14:53313 (J;US)

SEMICONDUCTOR COUNTERS
See SEMICONDUCTOR DETECTORS

SEMICONDUCTOR DETECTORS
See also GE SEMICONDUCTOR DETECTORS
SI SEMICONDUCTOR DETECTORS
IAEA research coordination meeting on X- and gamma-ray standards for detector efficiency calibration, Braunschweig, FRG, 31 May - 2 June 1989. Summary report, 14:53883 (R;XA)

SEMICONDUCTOR DEVICES
See also SEMICONDUCTOR DIODES
SEMICONDUCTOR LASERS
THYRISTORS
200 MeV, fast neutron and gamma ray effects on AlGaAs/GaAs HEMTs [high electron mobility transistors], 14:53098 (R;US)
Manufacturing equipment for semiconductor and N_2 plasma, 14:52647 (RA;JP;In Japanese)
Neutron hardness of silicon-based semiconductor devices, 14:53099 (J;US)
Particle beam technology, 14:52646 (RA;JP;In Japanese)
The influence of residual contamination on the structure and properties of metal/GaAs interfaces, 14:52954 (R;US)

SEMICONDUCTOR DIODES
Efficient second-harmonic generation of a diode-laser-pumped c-w Nd:YAG laser using monolithic MGo:$LiNbO_3$ external resonant cavities, 14:52893 (R;US)
High-repetition-rate femtosecond dye amplifier using a laser-diode-pumped neodymium:YAG laser, 14:52942 (R;US)
Monolithic MgO:$LiNbO_3$ doubly resonant optical parametric oscillator pumped by a frequency-doubled diode-laser-pumped Nd:YAG laser, 14:52939 (R;US)

SEMICONDUCTOR LASERS
Effect of period gain in continuous-wave (Al,Ga)As epitaxial surface-emitting lasers, 14:52918 (BA;US)
High-power single spatial mode AlGaAs channeled-substrate-planar semiconductor diode lasers for spaceborne communications. Final report, 16 July 1987-15 October 1988, 14:52903 (R;US)

SEMICONDUCTOR MATERIALS
See also N-TYPE CONDUCTORS
Atomistic calculation of stability and metastability of coherently strained silicon-like structures, 14:52674 (BA;US)
Characterization techniques for ion bombarded insulators, 14:52584 (BA;US)
Control of solid-excitation-based photochemical dry etching of semiconductors by ion-bombardment-induced damage, 14:52673 (BA;US)
Crystal chemistry, magnetic and electrical properties of La(2-x)$BaxNiO_4$, 14:52608 (R;US)
Diffusion of impurities in Si and its relation with point defects, 14:53892 (RA;JP;In Japanese)
Model of phonon-associated electron tunneling through a semiconductor double barrier, 14:52685 (J;US)
Neutron activation analysis for contamination control in device processing, 14:52683 (J;US)
Neutron activation for semiconductor materials characterization at Eastman Kodak Company, 14:52684 (J;US)
Proceedings of the specialist research meetings on semiconductors with research reactors, 14:52649 (R;JP)
[X-ray studies of strain, interface and impurity in semiconductors]: Technical progress report, July 1, 1988–June 30, 1989, 14:52645 (R;US)

SEPARATION PROCESSES

Solar-Geophysical Data Number 537, May 1989. Part 2 (comprehensive reports). Data for November 1988 and miscellaneous, 14:53614 (R;US)

SOLAR RADIO BURSTS
Effect of wave localization on plasma instabilities, 14:53970 (D;US)
Solar-Geophysical Data Number 537, May 1989. Part 2 (comprehensive reports). Data for November 1988 and miscellaneous, 14:53614 (R;US)

SOLAR SEA POWER PLANTS
See OCEAN THERMAL POWER PLANTS

SOLAR SIMULATORS
Characteristics of light source for solar simulator and solar simulator for evaluation of solar heat-collector function, 14:52116 (RA;JP;In Japanese)

SOLAR SPACE HEATING
Multi-story low-energy consumption buildings, 14:52115 (R;IT)

SOLAR THERMAL POWER PLANTS
Solar dynamic power for space station freedom, 14:52113 (R;US)
Transient performance evaluation of an integrated heat pipe-thermal storage system, 14:52114 (BA;US)

SOLAR WIND
Effect of wave localization on plasma instabilities, 14:53970 (D;US)
Electric fields in earth orbital space. Final report, 14:53623 (R;US)

SOLAR-ASSISTED HEAT PUMPS
The absorption system 'silica gel/water vapour'. Applications in solar air conditioning systems, 14:52438 (R;DE;In German)

SOLID CLUSTERS
Electromigration behavior of aluminum films deposited on silicon by ionized cluster beam and other techniques, 14:52945 (R;US)
Electromigration behavior of ionized cluster-beam-deposited aluminum films on SiO_2, 14:52943 (R;US)
Electron microdiffraction and channeling: Theory and applications, 14:53907 (D;US)

SOLID LUBRICANTS
Solid lubricant materials for high temperatures: A review, 14:52488 (RA;US)
Solid lubrication studied by optical means. Final report, 1 March 1986-28 February 1989, 14:52933 (R;US)

SOLID STATE LASERS
See also NEODYMIUM LASERS
SEMICONDUCTOR LASERS
Applications of new solid state lasers to the production of tunable VUV and XUV coherent radiation, 14:52912 (BA;US)
Coherent 70.9-nm radiation generated in neon by frequency tripling the fifth harmonic of a Nd:YAG laser, 14:52894 (R;US)
Development of mid-infrared solid state lasers for spaceborne lidar. Progress report, 13 October 1988-13 April 1989, 14:52904 (R;US)
Efficient monolithic MgO:$LiNbO_3$ singly resonant optical parametric oscillator, 14:52941 (R;US)
Efficient second-harmonic generation of a diode-laser-pumped c-w Nd:YAG laser using monolithic MGo:$LiNbO_3$ external resonant cavities, 14:52893 (R;US)
Efficient second-harmonic generation of a diode-pumped c-w Nd:YAG laser using an externally resonant cavity, 14:52892 (R;US)
Flashlamp-pumped performance of the solid state laser material $LiCaAlF_6:Cr^{3+}$, 14:52913 (BA;US)
High-repetition-rate femtosecond dye amplifier using a laser-diode-pumped neodymium:YAG laser, 14:52942 (R;US)
Monolithic MgO:$LiNbO_3$ doubly resonant optical parametric oscillator pumped by a frequency-doubled diode-laser-pumped Nd:YAG laser, 14:52939 (R;US)
OPO (optical parametric oscillators) performance with a long-pulse-length, single-frequency Nd:YAG laser pump, 14:52940 (R;US)
Optical materials for laser applications, 14:52909 (B;US)

SOLID STATE PHYSICS
Solid State Division: Progress report for period ending March 31, 1989, 14:53899 (R;US)

SOLID WASTES
See also SCRAP
WOOD WASTES
High density cleaning of waste paper feedstock for paper board manufacture. A demonstration project at Thames Board Ltd., Purfleet, 14:52478 (R;GB)
Investigation of pollutant emissions at sheffield municipal solid waste incinerator with assessment of long-term pollutant variability, 14:52505 (R;GB)
North Carolina sanitary landfills: Leachate generation, management, and water-quality impacts, 14:53263 (R;US)
RCRA (Resource Conservation and Recovery Act) orientation manual, 14:52381 (R;US)
Sampling and analysis of domestic refuse: A review of procedures at Warren Spring Laboratory. Report for January-August 1988, 14:52506 (R;GB)

SOLIDS
Advanced research in solids transport: Rheological behavior of dense suspensions: Third quarterly report, April 1, 1989–June 30, 1989, 14:51685 (R;US)
Anisotropic tight-binding model for localization, 14:53909 (J;US)
Real-space multiple-scattering theory and the electronic structure of systems with full or reduced symmetry, 14:53913 (J;US)

SOLUTIONS
See also FUEL SOLUTIONS
Solution as electrolytic systems. Interinstitute collection of scientific papers, 14:52818 (R;SU;In Russian)

SOLVENT EXTRACTION
Use of a surfactant to control interfacial driving forces for single droplet mass transport experiments characteristic of solvent extraction, 14:52760 (R;US)

SOMATIC CELLS
See also STEM CELLS

Polyacrylic acid-modified zinc phosphate conversion coatings for corrosion protection of steel, 14:52640 (R;US)
The effect of test conditions on the erosion-corrosion of alternate low alloy steel tubing alloys, 14:52582 (B;US)
[Fundamentals of materials processing]: Foreign trip report, December 30, 1987–January 31, 1988, 14:52572 (R;US)
[Implications of radiation-induced embrittlement for the integrity of pressure vessels]: Foreign trip report, November 2–10, 1987, 14:52250 (R;US)

STELLAR ATMOSPHERES
See also STELLAR CORONAE
IUE investigations of SN 1987A. Semiannual status report, August 1988-February 1989, 14:53611 (R;US)

STELLAR CORONAE
See also SOLAR CORONA
Solar and stellar coronal plasmas. Semiannual report Nos. 12-17, 1 May 1986-30 April 1989, 14:53607 (R;US)

STELLARATORS
See also JIPPT-2 DEVICE
PROTO-CLEO STELLARATORS
TORSATRON STELLARATOR
ECH plasma for different magnetic axis positions and initial ICRF plasma production experiments in CHS, 14:53942 (R;JP)
Electron behavior during electron cyclotron resonance heating in the interchangeable-module stellarator, 14:53966 (D;US)
Nonlinear saturation of ballooning modes in tokamaks and stellarators, 14:53665 (J;US)
Self-consistent bounce-averaged transport computations for stellarators, 14:53976 (D;US)

STEM CELLS
Method for protecting bone marrow against chemotherapeutic drugs and radiation therapy using transforming growth factor beta 1, 14:53411 (P;US)

STERILIZATION
See also RADIOSTERILIZATION
Field evaluation of direct-reading continuous ethylene oxide monitors. Final report, 14:53137 (R;US)

STIMULATION
Efficiency of early application of immunomodulators in combined effect of radiation and thermal injury, 14:53496 (RA;SU;In Russian)

STIRLING ENGINES
A historical perspective on Stirling engine performance, 14:52517 (BA;US)
Design integration and test of a heat pipe heated 100-HP Stirling engine, 14:52519 (BA;US)
Evaluation of a magnetic coupling for hermetic power transmission in a Stirling-Rankine heat pump, 14:52516 (BA;US)
Initial characterization of a modular heat exchanger with an integral heat pipe, 14:52928 (R;US)
Liquid piston seals for Stirling machines, 14:52518 (BA;US)
Outline of fuel/storage technology development, 14:52362 (RA;JP;In Japanese)
Performance measurements for a diaphragm-coupled, free-piston Stirling engine heat pump module, 14:52515 (BA;US)
Prediction of leakage mass flow rate through gas springs, 14:52513 (R;IT)
Result and final evaluation of research and development of general-purpose Stirling engine, 14:52514 (RA;JP;In Japanese)

STOCHASTIC PROCESSES
Non-rectangular sampling plan for estimating steady-state means. Technical report, 14:54031 (R;US)

STOMACH
Differential roentgenodiagnosis of stomach ulceration, 14:53355 (RA;SU;In Russian)
Functional roentgenoscopy of stomach and duodenum in diagnosis of chronic duodenal permeability disturbance, 14:53322 (RA;SU;In Russian)
Improved roentgenological technique for gastroesophageal reflux indentification, 14:53353 (RA;SU;In Russian)
Modern possibilities of complex introscopic diagnosis of stomach cancer, 14:53334 (RA;SU;In Russian)
Roentgenofunctional evaluation of small intestine motility evacuation from stomach and gallbladder in children, 14:53382 (RA;SU;In Russian)
Roentgenological picture of vagotomized stomach, 14:53326 (RA;SU;In Russian)

STONE METEORITES
See also CHONDRITES
Trebbin - another meteorite with a complex irradiation history?, 14:53590 (RA;DE;In German)

STOPPING POWER
Direction-dependent stopping power and beam deflection in anisotropic solids, 14:53859 (R;US)
Interaction of low-energy electrons and positrons with condensed matter: Stopping powers and inelastic mean free paths from optical data, 14:53860 (R;US)

STOPPING POWER (TOTAL ATOMIC)

SUPERCONDUCTING SUPER COLLIDER
Beam profile monitor by the method of rest gas ionisation, 14:53074 (RA;DE;In German)
Beam-beam interaction in an asymmetric collider for B-physics, 14:53057 (R;US)
Charge changing processes of the stored ion beam, 14:53056 (RA;DE;In German)
Design for a second-generation proton storage ring at LAMPF, 14:51992 (RA;US)
Filter target experiment (FILTEX), 14:53026 (RA;DE;In German)
Laser diagnostics and cooling of $^{7}Li^{+}$ and $^{9}Be^{+}$, 14:53031 (RA;DE;In German)
Opportunities for research program development at LANSCE (Los Alamos Neutron Scattering Center, 14:52013 (RA;US)

Physics and design issues of asymmetric storage ring colliders as B-factories, 14:53058 (R;US)
Ring magnets for the synchrotron x-ray source at ANL, 14:52878 (BA;US)
The Heidelberg heavy ion storage ring, 14:53055 (RA;DE;In German)
The proton storage ring: Problems and solutions, 14:52012 (RA;US)
Vacuum system for the synchrotron x-ray source at Argonne, 14:53060 (BA;US)
[Advanced accelerator physics featuring the problems of small rings]: Foreign trip report, September 16, 1989–September 29, 1989, 14:53059 (R;US)

STORES
See COMMERCIAL BUILDINGS

STRAND BREAKS
Single-strand breaks in DNA and transformation inactivation induced by tritiated water, 14:53513 (RA;JP)

STRANGE BARYONS
See HYPERONS

STRATEGIC DEFENSE INITIATIVE
See BALLISTIC MISSILE DEFENSE

STRATOSPHERE
Global temperature trends, 14:53148 (RA;US)
Stratospheric ozone depletion, 14:53178 (R;US)
Stratospheric ozone depletion: Antarctic processes, 14:53142 (RA;US)
Stratospheric ozone depletion: Global processes, 14:53141 (RA;US)
Theoretical projections of stratospheric change due to increasing greenhouse gases and changing ozone concentrations, 14:53146 (RA;US)

STREAK CAMERAS
An elliptical spectrograph/fiber-array/streak camera system for remote time-resolved spectral measurements in the x-ray region, 14:53982 (J;US)

STREETS
See ROADS

STRESS ANALYSIS
Large-scale structural analysis: The structural analyst, the CSM Testbed and the NAS System, 14:52851 (R;US)

STRING MODELS
Bogomol'nyi bounds for cosmic strings, 14:53596 (R;FR)
Calabi-Yau manifold of four generations, 14:53723 (J;US)
Casimir energy for a piecewise uniform string, 14:53732 (R;DK)
Consideration of BRST cohomology in the first quantization of RNS string, 14:53690 (R;CN)
Effective field theory from a β function for the p-adic string, 14:53741 (J;US)
Problems of superstring-inspired models with right-handed gauge symmetry, 14:53697 (R;SU)
Sigma-model duality and duality transformations in string theory, 14:53740 (J;US)

STRONTIUM 90
Cesium and strontium isotopes in the northwestern North Atlantic and Arctic Ocean, 1981-1985. Technical report, 14:53278 (R;US)
Determination of Sr-90 in environmental material using an improved rapid method, 14:52712 (RA;XA)
Radionuclides - correlations - possible uses, 14:53880 (RA;XA)

STRONTIUM 98
Magnetic moment of the 2_1^+ state in ^{98}Sr, 14:53782 (J;US)

STRONTIUM CHLORIDES
Structure and dynamics of particles in 1-1, 2-1, 3-1 electrolyte aqueous solutions, 14:52820 (RA;SU;In Russian)

STRONTIUM COMPOUNDS
See also STRONTIUM CHLORIDES
STRONTIUM FLUORIDES
STRONTIUM OXIDES
Growth and properties of alloyed crystals of BSN and $LiNbO_3$, 14:52793 (RA;SU;In Russian)
Spectroscopic and laser properties of Cr:$LiCaA1F_6$ and Cr:$LiSrA1F_6$ crystals, 14:52908 (R;US)

STRONTIUM FLUORIDES
Distribution of SrF_2 along $La_{1-x}Sr_xF_{3-x}$ monocrystals ($0.05 \leq x \leq 0.15$) during growth from melt, 14:52774 (RA;SU;In Russian)

STRONTIUM OXIDES
Giant superconducting anisotropy in $Bi_2Sr_2Ca_1Cu_2O_{8+\delta}$, 14:52629 (J;US)
Growth of rare earth ternary gallates from own melts, 14:52807 (RA;SU;In Russian)
Structure defects in $Sr(GaMgZr)_{12}O_{19}$ monocrystals grown by the Czochralski method, 14:52811 (RA;SU;In Russian)
[Theoretical studies on high-temperature superconductivity]: Foreign trip report, August 29, 1987–August 20, 1988, 14:53916 (R;US)

STRUCTURAL BUCKLING

SUGAR CANE
Electric power from sugar cane in Costa Rica. A technical and economic analysis, 14:52422 (R;US)

SUGARS
See SACCHARIDES

SULFATES
See also CALCIUM SULFATES
MOLYBDENUM SULFATES
ZIRCONIUM SULFATES
Acid rain in the United Kingdom: Spatial distributions and seasonal variations in 1986. Report for January 1986-August 1988, 14:53165 (R;GB)

SULFIDES
See also CADMIUM SULFIDES
EUROPIUM SULFIDES
GALLIUM SULFIDES
HYDROGEN SULFIDES
LANTHANUM SULFIDES
SAMARIUM SULFIDES
YTTERBIUM SULFIDES
ZINC SULFIDES
Determination of sulfide in spent caustic solutions from the chemical cleaning of coal, 14:51656 (J;NL)

SULFUR
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Time-resolved size distributions of sub-4 micrometers particle sulfur and nitrate. Final report, 14:53182 (R;US)
Ultra-thin, light-trapping silicon solar cells, 14:52078 (RA;US)
SULFUR 32 REACTIONS
High-spin studies of ^{172,173}Os: Complex alignment mechanism, 14:53787 (J;US)
Nuclear collisions at 200 GeV/u (HELIOS/NA34 experiment), 14:53784 (RA;DE;In German)
Possible dynamic effects in the particle decay of ^{59}Cu compound nuclei, 14:53848 (J;US)
SULFUR 34 REACTIONS
Discrete and continuous γ-spectra from the decay of Dy compound nuclei, 14:53777 (RA;DE;In German)
SULFUR 36 REACTIONS
Observation of superdeformation in ^{191}Hg, 14:53792 (J;US)
SULFUR COMPOUNDS
See also SULFATES
SULFIDES
SULFUR NITRIDES
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)
SULFUR DIOXIDE
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 1. Development of high reactivity sorbents. Final report, January 1986-December 1987, 14:51678 (R;US)
Evaluation of FGD (flue gas desulfurization) dry-injection sorbents and additives. Volume 2. Pilot plant evaluation of high-reactivity sorbents. Final report, January 1986-December 1987, 14:51679 (R;US)
Evaluation of internally staged coal burners and sorbent-jet aerodynamics for combined SO_2/NOx control in utility boilers. Volume 1. Testing in a 10 million Btu/hr experimental furnace. Final report, October 1982-June 1985, 14:52153 (R;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of selected gaseous constituents of the off-gases of a stationary fluidized-bed combustion system, 14:53191 (R;DE;In German)
Micrometeorological investigation of surface exchange of trace gases: A case study. Technical memo, 14:53179 (R;US)
SULFUR HYDRIDES
See HYDROGEN SULFIDES
SULFUR IONS
Resonant dielectronic and direct excitation in crystal channels, 14:52686 (J;US)
SULFUR ISOTOPES
Comparative metabolic behavior and interrelationships of Tc and S in soybean plants, 14:53542 (J;US)
SULFUR NITRIDES
NS(B) (nitrogen sulfide (B state)) spectrum theory and code. Technical report, January-May 1989, 14:52896 (R;US)
SULFUR SULFIDES
See SULFUR
SULFURIC ACID
Electrostatic precipitation of condensed acid mist: Fourth quarterly technical progress report, June 1–August 31, 1989, 14:52149 (R;US)
SUNSPOTS
Solar-Geophysical Data Number 537, May 1989. Part 1 (prompt reports). Data for April, March 1989, and late data, 14:53613 (R;US)
SUPERALLOYS
See HEAT RESISTING ALLOYS
SUPERCOMPUTERS

TRITIUM

Biological Radiation Effects
Dose-rate dependency of radiation-induced germ cell mutation. Development of a new mutation assay system using the fish, Medaka Oryzias latipes, 14:53524 (RA;JP)

Breeding Ratio
Analysis and intercomparison for phase I experiments at FNS [fusion neutron source], 14:54022 (J;US)
Measured neutron parameters for phase I experiments at the FNS [fusion neutron source] facility, 14:54023 (J;US)
Summary of recent results form the JAERI/US fusion neutronics phase 1 experiments, 14:54021 (J;US)

Coastal Waters
Tritium concentrations in natural waters in Japan before use of a large quantity of tritium on its fusion program, 14:53276 (RA;JP)

Environment
Japanese university program on tritium radiobiology and environmental tritium, 14:53498 (RA;JP)
Tritium concentrations in natural waters in Japan before use of a large quantity of tritium on its fusion program, 14:53276 (RA;JP)

Environmental Impacts
Tritium safety and environmental considerations in fusion studies at IPPJ, 14:54005 (RA;JP)

Monitoring
Development of aqueous tritium effluent monitor, 14:52281 (R;US)

Pellet Injection
Tritium proof-of-principle pellet injector results, 14:53988 (R;US)

Radioecological Concentration
Low levels of tritium and trace elements in autopsy tissue: Analytical methods, 14:53275 (R;IT;In Italian)

Radionuclide Kinetics
Can oxidation of tritium gas in intestine be suppressed by a drug in rats?, 14:53507 (RA;JP)
How far intensitive instillation will get rid of tritium from body of rats?, 14:53508 (RA;JP)
Japanese university program on tritium radiobiology and environmental tritium, 14:53498 (RA;JP)
Tritium metabolism in animals and estimation of the accumulated dose, 14:53529 (RA;JP)

Radionuclide Migration
Transfer of fallout ^{3}H from diet to human in Akita, Japan, 14:53503 (RA;JP)
Tritium concentrations in tree ring cellulose, 14:53530 (RA;JP;In Japanese)

Rats
Can oxidation of tritium gas in intestine be suppressed by a drug in rats?, 14:53507 (RA;JP)

Rbe
RBE of tritium beta radiation to gamma radiation and X-rays analyzed by both molecular and genetic methods, 14:53515 (RA;JP)

Skin Absorption
Tritium absorption through various types of trauma in the skin of hairless mice and its prevention, 14:53509 (RA;JP)

Tissue Distribution
Transfer of fallout ^{3}H from diet to human in Akita, Japan, 14:53503 (RA;JP)

Trees
Tritium concentrations in tree ring cellulose, 14:53530 (RA;JP;In Japanese)

TRITIUM COMPOUNDS
See also HYDROGEN TRITIDE
TRITIUM OXIDES
Cell death induced in mouse intestine by tritiated water, tritiated thymidine and gamma rays, 14:53521 (RA;JP)
Cell killing and mutation to 6-thioguanine resistance after exposure to tritiated amino acids and tritiated thymidine in cultured mammalian cells, 14:53519 (RA;JP)
Effect of organically bound tritium (OBT) on pre-implantation mouse embryos in vitro, 14:53527 (RA;JP)
Novel chromosomal response to low-level tritium. Adaptive response induced by ionizing radiation in cultured Chinese hamster cells, 14:53517 (RA;JP)

TRITIUM OXIDES
Atmospheric tritium in three different chemical forms in Fukuoka, 14:53205 (RA;JP)
Behavior of organically bound tritium in some plants under equilibrium and non-equilibrium environmental conditions, 14:53501 (RA;JP)
Bioassay of hair for estimation of body burden by tritium exposure, 14:53504 (RA;JP)
Carcinogenic effect of tritiated water (HTO) in mice in comparison with those of fission neutrons and gamma-rays, 14:53522 (RA;JP)
Chromosomal damage in human spermatozoa caused by in vitro irradiation of tritium β-rays, 14:53511 (RA;JP)
Development of a monitoring system for human exposure to tritium. Chromosome aberrations in human lymphocytes exposed to HTO, 14:53518 (RA;JP)
Effect of tritiated water on germ cells and fertility. A comparative study with tritium simulation using oocyte death of mouse newborns as index, 14:53525 (RA;JP)
Effect of tritiated water on human hemopoietic stem cells, 14:53510 (RA;JP)
High specific activity of organically bound tritium in pine needles and search for its cause in the environment, 14:53499 (RA;JP)
In vivo somatic mutation in mice induced by tritiated water, 14:53523 (RA;JP)
Intracellular damage of DNA induced by tritiated water and its restoration, 14:53514 (RA;JP)
Neoplastic transformation and chromosome aberration induced by tritiated water in golden hamster embryo cells, 14:53520 (RA;JP)
RBE of tritium beta-rays for cell killing of normal human cells in vitro, 14:53512 (RA;JP)
Radiolethal and genetic vulnerabilities of germ cells in the female mammal. Effects of tritium and other radiations compared, 14:53526 (RA;JP)
Safe-handling of tritiated water. Hood, monitoring and inventory, 14:52861 (RA;JP)
Single-strand breaks in DNA and transformation inactivation induced by tritiated water, 14:53513 (RA;JP)

Teratogenic effect of tritium water and tritium simulator on rat embryos, 14:53528 (RA;JP)
Tritium content in Japanese bodies, 14:53502 (RA;JP)

TRITIUM TARGET
Branching ratios for $^{3}He(\alpha,\gamma)^{7}Be$ and $^{3}H(\alpha,\gamma)^{7}Li$, 14:53847 (J;US)

TRU WASTES
See ALPHA-BEARING WASTES

TRUCKS
Light-duty automotive technology and fuel-economy trends through 1989. Technical report, 14:52512 (R;US)

URANIUM
See also ENRICHED URANIUM
NATURAL URANIUM
Calculation of the spallation product distribution in the evaporation process, 14:51995 (RA;US)
Change of the absolute cross section of the U(n, ^{8}Be) reaction at the neutron energy of 14.7 MeV, 14:53818 (RA;SU;In Russian)
Continuous measurement of uranium concentrations with the laser spark, 14:51902 (J;US)
Determination of uranium in environmental samples by fluorimetry, 14:52713 (RA;XA)
Double-layer structure model of the uranium generating bed in the land basins of the northwestern China and its significance, 14:51736 (R;CN;In Chinese)
Plant protection system to assure criticality safety in uranium extraction, 14:52890 (J;US)
Prospects for the uranium market, 14:51751 (J;US)
Some neutronic calculations for KENS-II, 14:51993 (RA;US)
Transmission-corrected x-ray fluorescence analysis of uranium and plutonium solutions using a dual transmission source, 14:51919 (J;US)
Validation studies performed with mixed Pu + U aqueous critical experiments in annual geometry, 14:51873 (J;US)

URANIUM 233 TARGET
Absolute measurements of ^{233}U, ^{235}U, ^{237}Np fission cross sections by 1.9 and 2.4 MeV neutrons by the method of time correlated associated particles, 14:53813 (RA;SU;In Russian)
Character of ν-bar$_p$ dependence on excitation energy and spins of fissile nuclei, 14:53807 (RA;SU;In Russian)

URANIUM 235
Detection of uranium from cosmos-1402 in the stratosphere, 14:53210 (J;US)

URANIUM 235 TARGET
Absolute measurements of ^{233}U, ^{235}U, ^{237}Np fission cross sections by 1.9 and 2.4 MeV neutrons by the method of time correlated associated particles, 14:53813 (RA;SU;In Russian)
Character of ν-bar$_p$ dependence on excitation energy and spins of fissile nuclei, 14:53807 (RA;SU;In Russian)
Constants of delayed neutrons, 14:53798 (RA;SU;In Russian)
Determination of the cross sections of delayed neutron production at microtron M-30, 14:53808 (RA;SU;In Russian)
Magnetic moment of the 2_1+ state in ^{98}Sr, 14:53782 (J;US)
Measurement of ^{236}U and ^{235}U fission cross section ratio in the neutron energy range of 0.5-3.72 MeV, 14:53802 (RA;SU;In Russian)
Prompt neutron spectra of ^{233}U, ^{235}U, ^{239}Pu, ^{252}Cf fission in the energy range of 0.01-12 MeV, 14:53812 (RA;SU;In Russian)

URANIUM 236
Investigation of shape isomeric states in actinides, 14:53793 (RA;DE;In German)

URANIUM 236 TARGET
Measurement of ^{236}U and ^{235}U fission cross section ratio in the neutron energy range of 0.5-3.72 MeV, 14:53802 (RA;SU;In Russian)

URANIUM 238
Preliminary site survey report for the former Elza Gate warehouse area, Oak Ridge, Tennessee, 14:53244 (R;US)

URANIUM 238 TARGET
Absolute cross section of the ^{238}U(n,2n) reaction at neutron energy of 14.76 MeV, 14:53814 (RA;SU;In Russian)
Absolute measurements of the U-238 fission cross section at 4.8 MeV, 8.4 MeV and 18.8 MeV neutron energies using the TCAM, 14:53817 (RA;SU)
Constants of delayed neutrons, 14:53798 (RA;SU;In Russian)
Cross section of the ^{238}U(n, 2n)^{237}U reaction induced by neutrons of ^{252}Cf spontaneous fission, 14:53815 (RA;SU;In Russian)
Determination of the cross sections of delayed neutron production at microtron M-30, 14:53808 (RA;SU;In Russian)
Prompt neutron spectra of ^{233}U, ^{235}U, ^{239}Pu, ^{252}Cf fission in the energy range of 0.01-12 MeV, 14:53812 (RA;SU;In Russian)

URANIUM BASE ALLOYS
Strengthening mechanisms of tungsten powder reinforced uranium, 14:52551 (R;US)

URANIUM COMPLEXES
Cyclic voltammetric study of organoactinide compounds of uranium(IV) and neptunium(IV). Ligand effects on the M(IV)/M(III) couple, 14:52847 (J;US)

URANIUM DEPOSITS
Lithogenesis and evolution of granites and their roles in the uranium-mineralization at LSS area of north-west China, 14:51737 (R;CN;In Chinese)

URANIUM DIOXIDE
A new method for UF_6 conversion to UO_2 with excellent characteristics, 14:52252 (J;US)

URANIUM FLUORIDES
See also URANIUM HEXAFLUORIDE
Assigning mass values to in-house standard UF_6 cylinders, 14:51899 (J;US)
Multicomponent monocrystal fluoride materials (synthesis, structure, properties), 14:52775 (RA;SU;In Russian)

URANIUM HEXAFLUORIDE
Cracking of 1-inch UF_6 cylinder valve packing nuts: The effects of packing nut torque on stem seal leakage and packing nut stress due to thermal expansion of the PTFE stem seal rings, 14:52550 (R;US)
Liquid-phase compositions from vapor-phase analyses: VI, Preliminary comparisons of calculations with experimental data on ClOsub 2F, CClFsub 2CClFsub 2, SFsub 6, and COsub 2, 14:51741 (R;US)

URANIUM MINES
Superfund Record of Decision (EPA Region 6): United Nuclear Corporation, Mckinley County, New Mexico, ground-water operable unit (first remedial action) September 1988, 14:51770 (R;US)

URANIUM NITRATES
Criticality experiments with mixed plutonium-uranium nitrate solution at plutonium fractions of 0.2, 0.5, and 1.0 in annular cylindrical geometry, 14:51872 (J;US)

URANIUM OXIDE FUEL PLANT
See MIXED OXIDE FUEL FABRICATION PLANTS

URANIUM RECYCLE
Radiation safety of thorium nuclear fuel cycle, 14:53877 (R;SU;In Russian)

URANIUM SILICIDES
Development of LEU [low enriched uranium] targets for ^{99}Mo production and their chemical processing status, 1989, 14:52838 (R;US)
Examinations of the irradiation behaviour of U_3Si_2 test fuel plates with low enrichment, 14:52285 (R;DE;In German)

URBAN AREAS
Analysis of air-toxics emissions, exposures, cancer risks, and controllability in five urban areas. Volume 1. Base year analysis and results, 14:53552 (R;US)
Estimation of contemporary carbon in fine-particle aerosols from the 1987 SCAQS (Southern California Air Quality Study) program. Final report, 14:53180 (R;US)
Light rail transit: New system successes at affordable prices. Special report, 14:52463 (R;US)
Modeling ozone concentrations: Urban- and regional-scale models are needed to develop emission-control policies that reduce ozone levels, 14:53174 (R;US)
ORION II bus demonstration. Demonstration report (Final), 14:52468 (R;US)
Private-sector contracting for transit services: Operator handbook, March 1989, 14:52467 (R;US)
Ridesharing and transportation for the disadvantaged. Transportation research record, 14:52375 (R;US)
Safety, loss control, and risk management: An assessment of practices at 17 US bus transit agencies. Final report, 14:52469 (R;US)
Urban freeway operations. Transportation Research Record, 14:52466 (R;US)

Air Pollution
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 2. Final report, 14:53215 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility, 14:53213 (R;US)
Theoretical models for evaluation of volatile emissions to air during dredged-material disposal with applications to New Bedford Harbor, Massachusetts. Final report, July 1987-June 1988, 14:53255 (R;US)

Incinerators
Investigation of pollutant emissions at sheffield municipal solid waste incinerator with assessment of long-term pollutant variability, 14:52505 (R;GB)
Source-emission testing of classified-waste incinerator, Griffiss AFB, New York. Final report, 19-23 September 1988, 14:52501 (R;US)

Land Pollution
Applications analysis report: HAZCON solidification process, Douglassville, Pennsylvania, 14:53248 (R;US)
Superfund Record of Decision (EPA Region 2): Marathon Battery, NY (second remedial action), September 1988 (reannounced), 14:53247 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 2, 14:52490 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Shirco pilot-scale infrared incineration system at the Rose Township Demode Road Superfund site. Volume 1. Final report, 14:53214 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 1, 14:52489 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. The American Combustion Pyretron Thermal Destruction System at the US EPA's (Environmental Protection Agency's) combustion research facility, 14:53213 (R;US)
Toxics-release inventory. Executive summary, 14:52380 (R;US)

Materials Recovery
Glass-contaminant removal from refuse-derived compost. Interim report. Report for April-July 1988, 14:52504 (R;GB)

Resource Recovery Acts
RCRA (Resource Conservation and Recovery Act) orientation manual, 14:52381 (R;US)

Solidification
Applications analysis report: HAZCON solidification process, Douglassville, Pennsylvania, 14:53248 (R;US)

Water Pollution
Superfund Record of Decision (EPA Region 2): Marathon Battery, NY (second remedial action), September 1988 (reannounced), 14:53247 (R;US)
Superfund Record of Decision (EPA Region 6): United Nuclear Corporation, Mckinley County, New Mexico, ground-water operable unit (first remedial action) September 1988, 14:51770 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 1, 14:52489 (R;US)
Technology evaluation report: SITE (Superfund Innovative Technology Evaluation) program demonstration test. Terra Vac In-Situ Vacuum Extraction System, Groveland, Massachusetts. Volume 2, 14:52490 (R;US)
Toxics-release inventory. Executive summary, 14:52380 (R;US)

WASTE FORMS
Comparison of unsaturated flow and transport models with volume and nitrate measurements from a pilot-scale, in-situ lysimeter with different geometry low level radioactive waste designs, 14:51759 (R;US)

WASTE ISOLATION PILOT PLANT

An emergency inventory system at the Oak Ridge Y-12 plant, 14:51907 (J;US)
Characterization of the ORNL [Oak Ridge National Laboratory] Biology Area process wastewater, 14:53256 (R;US)
Program appraisal of radiological protection at the Martin Marietta Energy Systems Oak Ridge complex, 14:52378 (R;US)
Stationary and portable instruments for assay of HEU solids holdup at Y-12, 14:51897 (J;US)
YTTERBIUM
Explosive crystallization of amorphous substances (Substances: V, Yb, CdTe, indium antimonides.), 14:52769 (RA;SU;In Russian)
YTTERBIUM COMPOUNDS
See also YTTERBIUM SULFIDES
Is YbAs a heavy Fermion system?, 14:53638 (R;US)
YTTERBIUM SULFIDES
Thermal conductivity of $La_{3-x}R_xS_4$ where R=Sm, Eu, and Yb, 14:52692 (J;US)
YTTRIUM
Laser driven photocathode studies for high gradient accelerators, 14:53040 (BA;US)
YTTRIUM 90
Determination of Sr-90 in environmental material using an improved rapid method, 14:52712 (RA;XA)
YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES
FERRITE GARNETS
YTTRIUM COMPOUNDS
YTTRIUM COMPOUNDS
See also YTTRIUM OXIDES
YTTRIUM SILICATES
Brief review of recent superconductivity research at NIST (National Institute of Standards and Technology). Bi-monthly report, 14:52625 (R;US)
Crystal growth of $LiNbO_3$:Y with regular domain structure in [011-bar2] direction, 14:52804 (RA;SU;In Russian)
Synthesis and investigation of monocrystals of rare earth scandoborates with chantite structure, 14:52797 (RA;SU;In Russian)
YTTRIUM OXIDES
Application of eV neutron scattering and eV neutron absorption techniques, 14:51959 (RA;US)
Correlation of thermally stimulated luminescence with radio frequency surface resistance of high-temperature superconductors, 14:52632 (J;US)
Flux pinning and microstructure in $YBa_2Cu_3O_7$, 14:52610 (R;US)
Influence of oxygen concentration on processing $YBa_2Cu_3O_{7-x}$, 14:52633 (J;US)
Investigation of heterogeneity of phase and chemical composition of $Y_{3-x-y}Ce_xTb_yAl_5O_{12}$ crystals, 14:52816 (RA;SU;In Russian)
Investigation of ideality degree of hafnium dioxide monocrystals, 14:53645 (RA;SU;In Russian)
Ion beam analysis and modification of thin-film, high-temperature superconductors, 14:52621 (R;US)
Monocrystal growth of solid solutions on the basis of zirconium dioxide alloyed with titanium, 14:52783 (RA;SU;In Russian)
Morphology of crystals of alumo-yttrium garnets, grown from melt by the Czochralski method, 14:52772 (RA;SU;In Russian)
Origin of the "linear" term in the specific heat of $YBa_2Cu_3O_7$, 14:52622 (R;US)

Static and dynamic magnetization properties of $Y_1Ba_2Cu_3O_z$ thin films, 14:52611 (R;US)
Study of high T_c superconducting thin films grown by MOCVD [metalorganic chemical vapor deposition]: Progress report, July 1, 1986–September 30, 1989, 14:52615 (R;US)
Surface resistance of $YBa_2Cu_3O_7$ films on $SrTiO_3$ and $LaGaO_3$ substrates, 14:52631 (J;US)
[Theoretical studies on high-temperature superconductivity]: Foreign trip report, August 29, 1987–August 20, 1988, 14:53916 (R;US)
[X-ray studies of strain, interface and impurity in semiconductors]: Technical progress report, July 1, 1988–June 30, 1989, 14:52645 (R;US)

YTTRIUM SILICATES
Growth, physical properties and application of monocrystals of yttrium and scandium oxoorthosilicates, 14:52800 (RA;SU;In Russian)

YUCCA MOUNTAIN
The Yucca Mountain Project Prototype Testing Program: 1989 Status report, 14:51765 (R;US)

Design
A conceptual design for a nuclear waste repository at the Yucca Mountain site, 14:51840 (J;US)

Geochemical Surveys
Mineralogic, petrologic, and geochemical studies of the volcanic rocks at Yucca Mountain, Nevada, for high-level waste disposal, 14:51839 (J;US)

Ground Water
Preliminary estimates of groundwater travel time at Yucca Mountain, 14:51844 (J;US)

Hydrology
Characterization of the subregional groundwater flow system of Yucca Mountain and vicinity, Nevada-California, 14:51837 (J;US)
Conceptual model of flow and solute transport in the unsaturated zone beneath Yucca Mountain, Nevada, 14:51838 (J;US)

Mineralogy
Mineralogic, petrologic, and geochemical studies of the volcanic rocks at Yucca Mountain, Nevada, for high-level waste disposal, 14:51839 (J;US)

Petrology
Mineralogic, petrologic, and geochemical studies of the volcanic rocks at Yucca Mountain, Nevada, for high-level waste disposal, 14:51839 (J;US)

Program Management
A top-level strategy for postclosure performance assessment of Yucca Mountain, 14:51842 (J;US)

Radiation Hazards
Assessment of worker and nonworker radiological safety of a repository, 14:51847 (J;US)

Radioactive Waste Disposal
A description and status of the Yucca Mountain Project repository sealing program, 14:51778 (R;US)
A review of degradation behavior of container materials for disposal of high-level nuclear waste in tuff and alternative repository environments, 14:51753 (R;US)
Use of performance assessments to generate a repository Q list, 14:51799 (J;US)

Radionuclide Migration
Assessment of radionuclide retardation, 14:51845 (J;US)

Seismicity
Assessment of seismic hazards at Yucca Mountain, 14:51846 (J;US)

Tectonics
Neotectonics and volcanism at Yucca Mountain and vicinity, Nevada, 14:51836 (J;US)

Testing
Deriving a site characterization program from applicable regulations, 14:51841 (J;US)

Tuff
Characterization of the subregional groundwater flow system of Yucca Mountain and vicinity, Nevada-California, 14:51837 (J;US)
Conceptual model of flow and solute transport in the unsaturated zone beneath Yucca Mountain, Nevada, 14:51838 (J;US)
Site characterization at Yucca Mountain, 14:51834 (J;US)
Stratigraphic and structural framework of Yucca Mountain, Nevada, 14:51835 (J;US)

Volcanism
Neotectonics and volcanism at Yucca Mountain and vicinity, Nevada, 14:51836 (J;US)

YUKAWA POTENTIAL
Macroscopic model description of heavy-ion induced complex-fragment emission, 14:53821 (R;FR)

Z

Z NEUTRAL BOSONS
Charm quark contribution to the W and Z cross sections at pp-bar colliders, 14:53709 (R;GB)
Diffractive heavy flavor production-including W^{+-} and Z^0, 14:53735 (BA;US)
Initial measurements of *Z*-boson resonance parameters in e^+e^- annihilation, 14:53686 (J;US)
Measurement of the mass and width of the Z^0 boson at the Fermilab Tevatron, 14:53687 (J;US)
Measuring static quark properties at LEP, 14:53707 (R;DE)

Z PINCH DEVICES (LINEAR)
See LINEAR Z PINCH DEVICES

ZINC
Distribution and mobilization of arsenic and antimony species in the Coeur d'Alene River system. Research report (Technical), 14:53264 (R;US)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of an industrial waste incineration plant, 14:53194 (R;DE;In German)
Measurement and assessment of the heavy metal emissions from selected installations and suggested measures for their reduction. Partial report on measurements of the heavy metal and trace element emissions of a stationary fluidized-bed system, 14:53190 (R;DE;In German)

ZINC 64 TARGET
Direct decay of giant resonances in medium-heavy nuclei, 14:53773 (RA;DE;In German)

ZINC 74
Structure of odd-odd ^{74}Ga from the decay of neutron-rich ^{74}Zn, 14:53775 (J;US)

ZINC COMPOUNDS
See also ZINC PHOSPHATES
ZINC SELENIDES
ZINC SULFIDES
ZINC TELLURIDES
ZINC TUNGSTATES
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)

ZINC DISTILLATION PROCESS
See PYROCHEMICAL REPROCESSING

ZINC IONS
A study of micellar-enhanced ultrafiltration: Progress report, March 1, 1989–February 28, 1990, 14:52709 (R;US)

ZINC PHOSPHATES
Polyacrylic acid-modified zinc phosphate conversion coatings for corrosion protection of steel, 14:52640 (R;US)

ZINC SELENIDES
Radiation effect in and properties of compounds of II-VI group, 14:52650 (RA;JP;In Japanese)

ZINC SULFIDES
Radiation effect in and properties of compounds of II-VI group, 14:52650 (RA;JP;In Japanese)

ZINC TELLURIDES
Investigation of some properties of melts of compounds of A^2B^6 group, 14:52782 (RA;SU;In Russian)
X-ray topographic study of real structure of cadmium telluride monocrytals, 14:52813 (RA;SU;In Russian)

ZINC TUNGSTATES
Peculiarities of crystal formation of new double molybdates and tungstates, 14:52803 (RA;SU;In Russian)
ZINC-BROMINE BATTERIES
Membrane and durability studies for the zinc/bromine battery, 14:52370 (R;US)
Zinc/bromine battery evaluation at SNL [Sandia National Laboratory], 14:52368 (R;US)
ZIRCONIUM
Influence of short range chemical order on density of states in α-ZrNi, 14:52544 (R;BR;In Portuguese)
On the kinetics of repassivation of freshly formed zirconium surface, 14:52832 (RA;SU;In Russian)
ZIRCONIUM 90 REACTIONS
Search for many-phonon excitations in ^{232}Th, 14:53795 (RA;DE;In German)
ZIRCONIUM 90 TARGET
Excitation of giant resonances in heavy ion reactions at intermediate energies, 14:53646 (R;FR)
ZIRCONIUM 95
Equilibrium and extraction mechanism from monomeric and polimeric species of zirconium in solution. part. 2, 14:52718 (R;BR;In Portuguese)
ZIRCONIUM 96
An octupole two-phonon multiplet in ^{96}Zr and its description within the spdf interacting boson model, 14:53845 (J;NL)
ZIRCONIUM COMPOUNDS
See also ZIRCONIUM OXIDES
ZIRCONIUM SULFATES
Remarkably diverse interstitial chemistry of the polar intermetallic phase Zr_5Sb_3, 14:52596 (J;US)
ZIRCONIUM OXIDES
Monocrystal growth of solid solutions on the basis of zirconium dioxide alloyed with titanium, 14:52783 (RA;SU;In Russian)
Monocrystals of gallium garnets with heterovalent substitutions, 14:52796 (RA;SU;In Russian)
Potential applications of structural ceramic composites in gas turbines: Final report, 14:52146 (R;US)
Structure defects in $Sr(GaMgZr)_{12}O_{19}$ monocrystals grown by the Czochralski method, 14:52811 (RA;SU;In Russian)
Zirconia based ceramics, 14:52618 (R;BR;In Portuguese)
ZIRCONIUM SULFATES
Thermochemistry of interaction between zirconium disulfate and sulfuric acid, 14:52829 (RA;SU;In Russian)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.
AC01-88ER30131	**Consultec Scientific, Inc., Knoxville, TN (USA)**

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	*Abstract Number*	*Source of Availability*	*GPO Dep.*	*Order Number*	*Distribution Category*

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ ZIP _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ ZIP _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no. _____

☐ Check/Money Order enclosed for $ _____

☐ Charge to my ☐ American Express ☐ VISA ☐ MasterCard

_____ _____
Account Number Card expiration date

☐ Ship & Bill (see below for restrictions)

Employer identification number (9 digits) __ __ - __ __ __ __ __ __ __

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
